Introduction

The following is a description of the organizations that were instrumental in the development and production of this report.

Texas Center for Nursing Workforce Studies

The Texas Center for Nursing Workforce Studies (TCNWS) was established under the governance of the Statewide Health Coordinating Council (SHCC). The Center for Health Statistics (CHS) at the Department of State Health Services (DSHS) provides administrative oversight. The TCNWS serves as a resource for data and research on the nursing workforce in Texas. The TCNWS is charged to collect and analyze data and publish reports related to educational and employment trends of nursing professionals; the supply and demand of nursing professionals; nursing workforce demographics; migration of nursing professionals; and other issues concerning nursing professionals in Texas as determined necessary by the TCNWS Advisory Committee (TCNWSAC) and SHCC.

One of the roles of the TCNWS includes collaboration and coordination with other organizations that gather and use nursing workforce data, such as the Texas Board of Nursing, the Texas Higher Education Coordinating Board, Texas Nurses Association, Texas Hospital Association, and regional healthcare organizations and educational councils. This coordination is needed in order to avoid duplication of efforts in gathering data; to avoid overloading employers and educators with completing a large number of duplicate surveys; to share resources in the development and implementation of studies; and to establish better sources of data and methods for providing data to legislators, policy makers and key stakeholders. The TCNWS is currently working on several statewide studies that will provide current and pertinent supply and demand trends on the nursing workforce in Texas. For more information about the TCNWS and access to its reports visit <http://www.dshs.state.tx.us/chs/cnws/>.

Texas Center for Nursing Workforce Studies Advisory Committee

In response to the passage of House Bill 3126 from the 78th Regular Legislative Session, the TCNWS and the TCNWSAC were established in 2004. The

TCNWSAC was added to the structure of the SHCC and serves as a steering committee for the TCNWS. This is a 21-member committee with representation from nursing and healthcare organizations, employers of nurses, state agencies, nurse researchers, and nurse educators as well as a consumer member. A list of TCNWSAC members is located on page 8.

The TCNWSAC is charged with the following responsibilities:

- Develop priorities and an operations plan for the TCNWS;
- Review, critique, and develop policy recommendations regarding nursing workforce issues;
- Identify other issues concerning nursing professionals in Texas that need further study; and
- Critique and analyze reports and information coming from the TCNWS before dissemination.

Statewide Health Coordinating Council

In accordance with Chapter 104-105 of the Health and Safety Code, the purpose of the SHCC is to ensure health care services and facilities are available to all citizens through the development of health planning activities. The SHCC is a 17-member council, with 13 members appointed by the governor and four members representing the Health and Human Services Commission, the Department of Aging and Disability Services (DADS), the Department of State Health Services, and the Texas Higher Education Coordinating Board. The SHCC meets quarterly and oversees the Health Professions Resource Center (HPRC), TCNWS, and the TCNWSAC. Information on the SHCC is available at the following website: <http://www.dshs.state.tx.us/chs/shcc/>.

Center for Health Statistics

The CHS is the DSHS' focal point for the collection, analysis, and dissemination of health-related information to evaluate and improve public health in Texas.

The mission of the CHS is accomplished by:

- Evaluating existing data systems for availability, quality, and quantity;

- Defining data needs and analytic approaches for addressing these needs;
- Adopting standards for data collection, summarization, and dissemination;
- Coordinating, integrating, and providing access to data;
- Providing guidance and education on the use and application of data;
- Providing data analysis and interpretation; and
- Initiating participation of stakeholders while ensuring the privacy of the citizens of Texas.

Health related and health professions workforce information and reports produced through the Center for Health Statistics are available at the following website: <http://www.dshs.state.tx.us/chs/>.

Texas Nurses Association

Introduction

This report describes the current supply of the nursing workforce and per population distribution of nurses in Texas. Trends are examined and the future of nursing is considered by examining projected job growth and the effects of the economy on the supply of nurses. The report is broken down into sections by nurse type, including Registered Nurses (RNs), Advanced Practice Registered Nurses (APRNs), Licensed Vocational Nurses (LVNs), and Certified Nurse Aides (CNAs). The APRN section includes sub-sections for each APRN type (Nurse Practitioner, Certified Registered Nurse Anesthetist, Clinical Nurse Specialist, and Certified Nurse Midwife). Each section of this report provides a description of demographics and trends on the nursing workforce in Texas. The data within is provided to support the work of nurse stakeholders and policy makers.

Summary

The supply of nurses in Texas is still low in comparison to national numbers. The numbers of RNs and APRNs per 100,000 population in Texas are below the U.S. average; LVNs are the exception in Texas, with a larger ratio of providers to population than the national ratio. Throughout the report, comparisons of U.S. and Texas nurse supply trends are based on data reported according to the ratio of providers per 100,000 population.

Highlights of the 2013 Texas nursing workforce include:

- **Supply:** From 2000 to 2013, the number of RNs and LVNs grew by 57.9% and 27.5%, respectively, compared with a 27.9% increase in the Texas population over the same time period. The supply of APRNs in Texas grew by 50.9% from 2007 to 2013, compared with 12.4% growth in the Texas population over the same time period. However, the supply ratios of RNs and APRNs in Texas lagged behind those of other states and the national supply ratio.
- **Age:** The aging of the nursing workforce continues to be a concern in Texas. As described by Buerhaus, et al. (2013), in 2011, the oldest members of the baby boom generation reached

the age of 65, and in 2014, the youngest members of the baby boom generation turn 50. More than half of baby boomers will be eligible for retirement by 2020, which could result in an outflow from the nursing workforce. In Texas, 41.3% of RNs and 40.5% of APRNs were over the age of 50 in 2013, compared to 34.1% of LVNs.

- **Diversity:** The nursing workforce is slowly diversifying in terms of race/ethnicity and sex. Although the race/ethnicity of the RN workforce does not match that of the Texas population, the RN workforce is shifting toward that of the Texas population (11.5% black/African American in 2013 compared to 6.7% in 2000 and 13.5% Hispanic/Latino in 2013 compared to 7.2% in 2000). The proportion of males in the RN workforce has been increasing slowly, from 8.4% in 2000 to 11.4% in 2013. As in years past, males are more represented among APRNs (18.2% male) than among LVNs (10.9%) and RNs (11.4%).
- **Education:** The Texas nursing workforce is progressing toward the Institute of Medicine's goals that 80 percent of RNs have a baccalaureate in nursing (BSN) by 2020 and that the number of nurses with doctorates double by 2020. In 2013, 52.1% of RNs had a BSN or more advanced degree, up from 49.7% in 2011 when the IOM report was published, and 1,108 RNs (0.6%) held a doctorate degree, up from 853 (0.5%) in 2011.
- **Employment:** Similar to the national nursing workforce, 65.5% of RNs were working in outpatient or inpatient hospital care. The distribution of employment settings among RNs has remained almost the same since 2001. Home health and long term care remain the top employment settings for LVNs.

Conclusion

This report presents as complete a picture as can be constructed with available data on RNs, APRNs, LVNs, and CNAs in Texas. It is a data and information resource for legislators, policy makers, and planners that informs long-term planning projects and aids

in evaluating programs designed to improve Texans' access to health care providers. With a focus on the supply side of the nursing workforce and per population distribution of nurses in Texas, it can also serve as a resource for those who are conducting research, who are planning projects and developing proposals, and who have questions about the nursing workforce in Texas. 🇹🇽

Re-licensure and certification data collected from the Texas BON and Texas Department of Aging and Disability Services (DADS) were processed and provided by the Health Professions Resource Center (HPRC). All reported data represent the licensed health professionals actively practicing in Texas. Inactive or retired licensed professionals were excluded, except where noted. RNs were classified as active if the re-licensure file indicated that their license status was “Current,” “Current (Notified for Renewal),” or “Current (Processing Renewal).” Nurses with active licenses may or may not be employed in nursing. Nurses were classified as working in nursing if they indicated that their employment status was “Employed in Nursing Full Time” or “Employed in Nursing Part Time.” Nurses were classified as working in Texas if they indicated that their primary practice state (or mailing address state if practice address was not available) was Texas. The APRN licensure file was matched with the RN re-licensure file to obtain demographic data on APRNs. Some APRNs certified in Texas may not hold a Texas RN license and thus demographic data was not available for these nurses.

National supply data was collected from the Health Resources and Services Administration (HRSA) and the Bureau of Labor Statistics (BLS). Data collection methods for the U.S. and other states often vary from those of Texas, making direct comparisons between ratios difficult. The national supply data for RNs and LVNs were obtained from the HRSA analysis of 2008 to 2010 American Community Survey data. The national supply data for APRNs were obtained from the BLS Occupational Employment Statistics estimates, which uses survey data from 2010 to 2013 to estimate the 2013 national APRN supply. U.S. population data were obtained from the U.S. Bureau of the Census population estimates based on the 2010 Census. Texas population data were obtained from the Texas State Data Center population projections released in 2012.

The supply ratios for the various categories of nurses are examined in relation to border and metropolitan status. Additionally, in Texas, information is provided on position type and employment field, status of education, and specialty area, if applicable.

For each nurse profession, an in-depth description is provided on nursing supply, the number of counties that do not have that provider type, providers per 100,000 population, nurse demographics by race/ethnicity, gender, and median age, and education data over several years (as data were available). This report contains as much of the supply trends and demographic information as is possible for HPRC to obtain from licensing and certification boards or registries. Please note that the Texas BON and the DADS differ on how they collect address information. If available, the county totals for each profession are based on the practice address from licensure data, and from the mailing/residence address if the practice address is not available. Therefore, when the mailing/residence address is used, the county supply totals may not accurately reflect the actual number of nurses working in a county since a professional may live in one county but practice in another. In 2007, the 80th Texas Legislature passed SB 29 which was

directed towards the collection of a minimum dataset of information on health professionals including more complete data on practice address. Beginning in March 2008, the BON started implementing the new minimum dataset which was collected on a portion of the RN license renewal records. DADS collects only a mailing address on Certified Nurse Aides.

Supply ratios are calculated by dividing the number of providers in a given nurse profession by the population of the area being evaluated, and multiplying that number by 100,000. This results in

a ratio of providers per 100,000 population that can be used to compare areas with different population sizes and over time.

The definitions of metropolitan and non-metropolitan counties were obtained from the U.S. Office of Management and Budget. The 32 counties within 100 kilometers of the U.S.-Mexico border are designated as border counties as defined by the “La Paz Agreement” (La Paz Agreement, 1983). The 2003 report used the 43 border counties definition as designated by the 76th Legislature (SB 1378); therefore, comparison of border county supply and trends to the 2003 report is not valid.

This report and previous versions are available at <http://www.dshs.state.tx.us/chs/cnws/>. 

Registered Nurses

RNs

Registered nurses (RNs) use specialized judgment and skills to provide and coordinate patient care by practicing within the parameters set by the Texas Nursing Practice Act (NPA) and the BON Rules and Regulations. According to the BON, RN scope of practice includes:

“the observation, assessment, intervention, evaluation, rehabilitation, care and counsel, or health teachings of a person who is ill, injured, infirm, or experiencing a change in normal health processes; the maintenance of health or prevention of illness; the administration of medication or treatment as ordered by a physician, podiatrist, or dentist; the supervision or teaching of nursing; the administration, supervision, and evaluation of nursing practices, policies, and procedures; the requesting, receiving, signing for, and distribution of prescription drug samples to patients at practices at which an advanced practice registered nurse is authorized to sign prescription drug orders; the performance of an act delegated by a physician; and the development of the nursing care plan.” (BON, 2014)

The NPA permits RNs to engage in independent practice within the scope of their licensure, not including making medical diagnoses or prescribing treatment. RNs must graduate from a state-approved school of nursing, pass a national certification examination (the NCLEX-RN), and obtain a license from the BON to practice as an RN in Texas.

2013 Texas Registered Nurse Facts:

White/Caucasian	63.0%
Black/African American	11.5%
Hispanic/Latino	13.5%
Other	12.0%
Male	11.7%
Female	88.3%
Median Age	46
Median Age Male	44
Median Age Female	46
Number of Counties with no RNs	4

Supply of Registered Nurses in Texas:

Year	Number	RNs/100,000 Population
1990	81,320	478.7
1996	103,358	540.3
2000	124,495	611.9
2005	144,602	628.6
2007	155,858	656.8
2009	169,446	681.2
2011	184,467	733.6
2013	196,571	737.2

2013 Registered Nurses/100,000 Population

Border Metropolitan	545.7
Non-border Metropolitan	795.6
Border Non-metropolitan	278.9
Non-border Non-metropolitan	507.5

Supply

Compared to the US rates and those of comparable states, Texas reports a smaller supply of RNs per 100,000 population. In coming years increased demand for health care services due to the full implementation of the Patient Protection and Affordable Care Act (PPACA) in 2014 (Holahan, Buettgens, Carroll, & Dorn, 2012), an aging population, and an increase in the prevalence of chronic disease will all contribute to the need to grow the nursing workforce. Auerbach, et al. (2013a) also posit that new methods of care delivery supported by the PPACA, such as patient-centered medical homes and nurse-managed health centers, could increase the demand for APRNs, RNs, LVNs, and CNAs. The BLS projects that an additional 711,900 RNs will be needed nationally by 2020 in order to meet demand (2013). Even though the supply ratios of RNs, APRNs, and LVNs have grown over the past several years, Auerbach, Staiger, Muench, & Buerhaus (2013b) caution that there are still uncertainties that may negatively impact the supply of nurses in the future.

Additionally, with the median age of RNs at 46 years, the aging of the nursing workforce is still a topic of concern. Although Buerhaus, Auerbach, Staiger, & Muench (2013) reported that the southern region of the U.S. has a greater number of RNs aged 34 or younger than other areas of the country, the proportion of RNs aged 34 or younger in Texas is lower than in most regions of the US. Still, this proportion has been growing in Texas, from 18% in 2005 to 20.5% in 2013. Staiger (2012) projects that if the unemployment rate decreases as anticipated by 2015, many RNs will exit the workforce, coinciding with the expected retirement of many “baby boomer” RNs. Buerhaus, et al. (2013) assert that in order to avoid a nursing shortage, the number of new RNs entering the workforce must be greater than the number of retiring RNs leaving the workforce.

According to the HPRC nursing re-licensure file for 2013, there were 231,728 RNs with active licenses, 207,199 RNs with active licenses working in nursing, and 196,571 RNs with active licenses working in

nursing in Texas (Table A1, Figure A1).

The 196,571 RNs equates to a

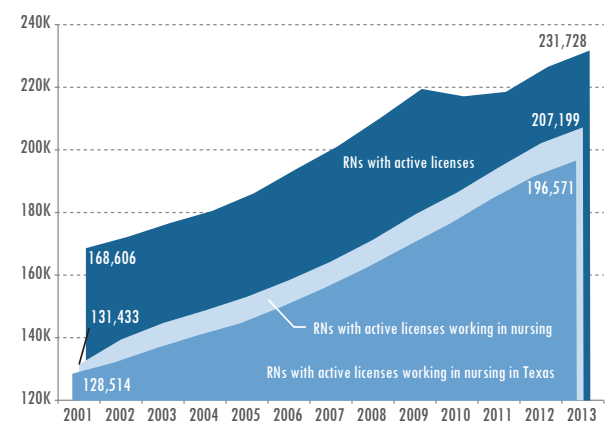

supply ratio of 737.2 RNs per 100,000 population. This represents 0.5% growth since 2011 and 20.5% since 2000, while the absolute number of RNs has grown by 6.6% since 2011 and 57.9% since 2000.

Table A1. Supply of RNs, Texas, 2013

2013 Texas Supply of Registered Nurses	
RNs with active licenses	231,728
RNs with active licenses working in nursing	207,199
RNs with active licenses working in nursing in Texas	196,571

Note: Nurses were classified as active if the re-licensure file indicated that their license status was “Current,” “Current (Notified for Renewal),” or “Current (Processing Renewal).” Nurses with active licenses may or may not be employed in nursing. Nurses were classified as working in nursing if they indicated that their employment status was “Employed in Nursing Full Time” or “Employed in Nursing Part Time.” Nurses were classified as working in Texas if they indicated that their primary practice state (or mailing address state if practice address was not available) was Texas.

Figure A1. Number of RNs in Texas, 2001-2013

Another factor that may affect the supply of RNs in Texas is the recent economic recession. Staiger (2012) developed a model showing that the increase in the supply of nurses from 2007 to 2012 may be due to the economic recession that began in 2007. During this time, nurses who were not working may have returned to the workforce, and older nurses may have delayed retirement. Additionally, nurses from other parts of the country may have relocated to Texas during this time as Texas fared better than other parts of the country during the recession.

Trends in Texas support Staiger’s model; 16,306 RNs who reported an employment status of unemployed, inactive, or retired in 2007 had returned to the nursing workforce by 2013. Another 1,452 RNs who had been working in a field other than nursing

The 196,571 RNs equates to a supply ratio of 737.2 RNs per 100,000 population.

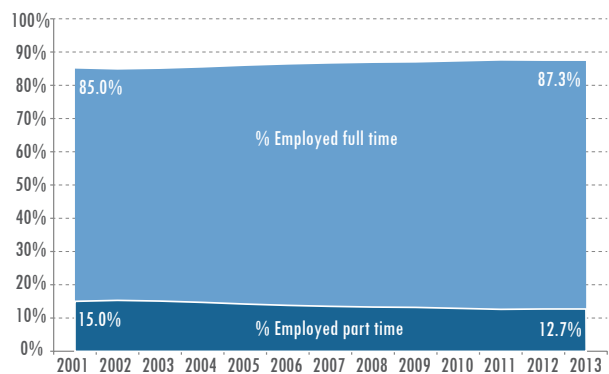

in 2007 had re-entered the nursing workforce by 2013. Figure A2 shows that the proportion of RNs with active licenses who were unemployed or retired remained relatively constant from 2001 to 2009, but between 2009 and 2011, it decreased from 15.2% to 7.9%. During the same period, the proportion of RNs with active licenses who were employed in nursing increased from 81.7% to 89%. The proportion of nurses who are employed in other fields has remained relatively constant since 2001.

Figure A2. Employment status of RNs with active licenses, 2001-2013

Of the 196,571 active RNs practicing in Texas, 87.3% were employed full-time in nursing and 12.7% were employed part-time in nursing. These proportions have not changed considerably since 2001 (Figure A3).

Figure A3. Percent of RNs employed full-time and part-time in nursing, 2001-2013

The Texas supply ratio continues to lag behind the U.S. supply ratio reported by the BLS (Figure A4). The BLS estimated that there were 2,661,890 RNs practicing in the United States as of May, 2013 for a supply ratio of 842 RNs per 100,000 population

nationwide. HPRC data on Texas RNs come from re-licensure numbers while national data on RNs come from surveys and projections, so it is difficult to draw direct comparisons between the supply ratios.

Figure A4. RNs per 100,000 population, US and Texas, 1987-2013

Source: HRSA

The Texas supply ratio of RNs also remains lower than the supply ratio of RNs in comparable states. The most recent comparable supply ratios are from 2012 in California, 2011 in Florida, and 2008 in New York. The Texas supply ratio of 732.2 RNs per 100,000 population in 2012 was slightly higher than the ratio of 712 RNs per 100,000 reported by California in 2012 (California HealthCare Foundation, 2014). The Texas supply ratio of 733.6 in 2011 was lower than the ratio of 885 reported by Florida in 2011 (Florida Center for Nursing at the University of Central Florida, Orlando, 2012). Since 1992, the Texas supply ratio of RNs has remained close to that of California and has been consistently lower than that of Florida and New York (Figure A5, see page 16). Other states' supply ratios come from surveys (Florida, California, and New York ratios from 1992 to 2008 come from the National Sample Survey of RNs (NSSRN), and California's ratio from 2012 comes from the California Board of Registered Nursing Survey of Registered Nurses) except Florida's supply ratios in 2009 and 2011, which come from nursing re-licensure files.

Supply ratios estimated from survey data are not directly comparable to the HPRC numbers, but Figure A5 shows that the NSSRN supply ratio for Texas has been a fairly close estimate of the actual supply ratio.

Although the RN population in Texas continues to

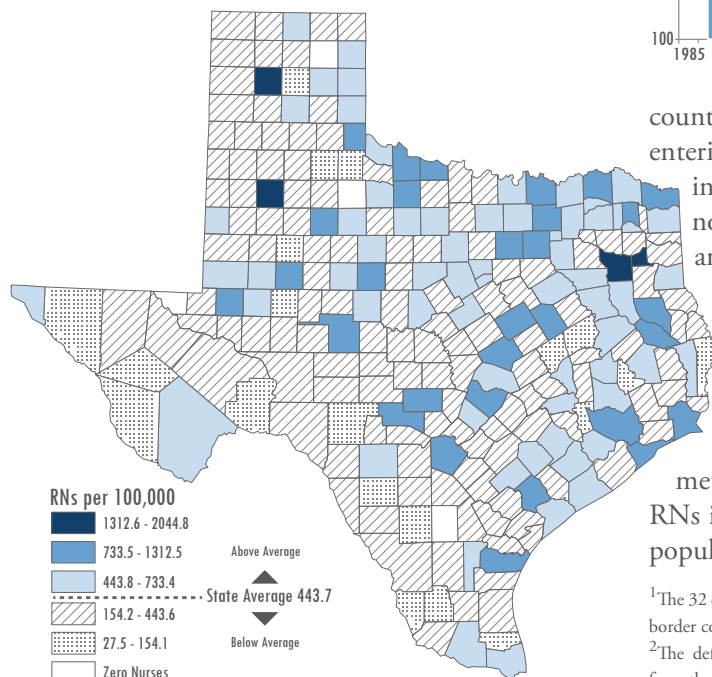

Figure A5. Employed RNs per 100,000 population, Texas, New York, Florida, and California, 1992-2013

Source: Florida Center for Nursing (2009-2011), California HealthCare Foundation (2012), National Sample Survey of RNs (1992-2008)

grow, the supply of RNs is not distributed evenly across the state. Figure A6 shows how much the supply of nurses per capita in each county differs from the average state supply ratio (737.2). It has been established that residents of border counties have a greater need for healthcare providers, because they experience higher rates of health problems such as diabetes, heart disease, and high blood pressure, as well as lower rates of health insurance coverage. Despite higher demand, these counties face provider shortages; the HRSA designated all counties along the Texas-Mexico border¹ as primary medical care

Figure A6. RNs per 100,000 population by practice county, Texas, 2013

health professional shortage areas (HPSAs) in 2012. Evidence shows that greater numbers of RNs per capita are associated with better population health (Bigbee, et al., 2014). Between 2006 and 2012, migration rates for RNs leaving border and non-metropolitan²

The supply of RNs is not distributed evenly across the state. Migration rates for RNs leaving border and non-metropolitan counties were substantially higher than rates for RNs entering those counties.

Table A2. Supply of RNs by county designation, 2013

County Designation	# RNs	RN's per 100,000 Population
Border Counties	14,092	510.4
Non-border Counties	182,479	763.4
Metropolitan Counties	181,505	770.2
Non-metropolitan Counties	15,066	486.0

Figure A7. RNs per 100,000 population, metropolitan and non-metropolitan counties, Texas, 1986-2013

counties were substantially higher than rates for RNs entering those counties, creating a greater discrepancy in supply numbers between metropolitan and non-metropolitan and border and non-border areas (Turner et al., 2013).

Since 2000, 173 of Texas' 254 counties have seen an increase in the supply ratio of RNs. 52 counties experienced a decrease in the absolute number of RNs practicing in the county from 2000 to 2013, 46 of which were non-metropolitan counties. In 2013, the supply ratio of RNs in border counties was 510.4 RNs per 100,000 population, which was much lower than the supply

¹The 32 counties within 100 kilometers of the U.S.-Mexico border are designated as border counties as defined by the "La Paz Agreement".

²The definitions of metropolitan and non-metropolitan counties were obtained from the U.S. Office of Management and Budget.

ratio of 763.4 in non-border counties. Only 7.7% of Texas RNs were practicing in non-metropolitan counties, and those counties contained 11.6% of the Texas population.

Metropolitan counties have consistently had a much higher ratio of RNs than non-metropolitan counties (Table A2, Figure A7). Four Texas counties, with a combined population of 2,048, had no practicing RNs in 2013.

Demographics

One of the goals of the US Department of Health and Human Services' Healthy People 2020 is to reduce health disparities related to gender and ethnicity. Minority racial/ethnic groups experience greater health disparities, such as higher rates of diabetes, heart disease, and infant mortality, and lower rates of health insurance coverage (CDC, 2013). They are also more likely to live in areas with health provider shortages (NACNEP, 2000). A more culturally competent nursing workforce that reflects regional racial/ethnic diversity in Texas can help reduce these disparities. A workforce that includes nurses who understand cultural values and can deliver culturally appropriate services will lead to better provider-patient interactions, decreased language barriers, and increased access to services for minorities.

Sex

In 2013, 88.3% of RNs were female. Since 2000, the

percentage of males has increased steadily from 8.4% to 11.7%, a 39.3% increase. A significantly higher percentage of male RNs worked in border counties (20.2% of all RNs working in border counties) compared to non-border counties (11.0% of all RNs working in non-border counties) ($\chi^2(1, N = 192,424) = 1033.9, p < .001$). A significantly greater proportion of RNs in metropolitan counties were male (11.9%) compared to non-metropolitan counties (9.7%) ($\chi^2(1, N = 192,424) = 61.6, p < .001$).

Age

The aging of the RN workforce is still a concern in Texas. From 2006-2010, Buerhaus et al. (2013) showed that RNs aged 50-64 made up from 32%-38% of the RN workforce in the Northeast, Midwest, South, and West regions of the US. This proportion is higher in Texas; in 2013, 41.3% of RNs in the state were 50 years or older. The authors suggest that states with larger proportions of nurses over 50 increase efforts to recruit new RNs and retain older RNs. Myer and Amendolair (2014) also suggest that retaining older nurses is essential to curbing the nursing shortage. Figure A8 shows the large proportion of RNs in Texas that are between the ages of 50 and 60. Many of these nurses will be eligible to retire in the next 10-15 years, which could lead to a large decrease in the nursing workforce

 In 2013, 41.3% of RNs in the state were 50 years or older.

Figure A8. Age and sex of RNs, 2013

if they are not replaced. Since nurses in Texas renew their licenses every other year, the 2013 re-licensure file does not account for newly licensed RNs who have graduated since 2011. This could mean that the younger RN cohort is underestimated in this report.

The median age of all RNs was 46 years in 2013, which was slightly lower than the median age of 47 years reported in 2010. Median age increased from 44 in 2000 to 47 in 2010, but has decreased to 46 since 2011. Male RNs were slightly younger than female

The population of new RN graduates in Texas more closely mirrored the racial/ethnic diversity of the Texas population, but still does not reflect the racial/ethnic distribution in the Texas population.

RNs (median age 44 years vs. 46 years). RNs who worked in border counties (median age 43 years) were significantly younger than those who worked in non-border counties (median age 46 years) ($F(1, 196569) = 471.0, p < .001$). RNs who worked in metropolitan counties (median age 46 years) were significantly younger than those who worked in non-metropolitan counties (median age 49 years) ($F(1, 196569) = 363.8, p < .001$).

Race/Ethnicity

Similar to years past, the majority of RNs reported a race/ethnicity of white/Caucasian (63.0%); however there has been a 19.2% decrease in the proportion of RNs who are white/Caucasian since 2000, when 78% of RNs were white/Caucasian. The percentage of black/African American RNs increased from 6.7% in 2000 to 11.5% in 2013 and the percentage of Hispanic/Latino RNs increased from 7.2% in 2000 to 13.5% in 2013. The other race category, which

Figure A9. Race/ethnicity of RNs, 2007 - 2013

includes Asian, Native Hawaiian/Pacific Islander, and American Indian/Alaskan Native among others, represented 12% of RNs in 2013, up from 8% in 2000. Figure A9 depicts changes in race/ethnicity since 2007. The population of new RN graduates in Texas in 2013 more closely mirrored the racial/ethnic diversity of the Texas population, suggesting that the demographic breakdown of RNs is shifting toward that of the Texas population.

Although the Texas RN population is slowly becoming more diverse, it still does not reflect the racial/ethnic distribution in the Texas population. Figure A10 shows that the proportion of white/Caucasian RNs was much larger than the proportion of white/Caucasian Texans in 2013, and the proportion of Hispanic/Latino Texans was more than twice the proportion of Hispanic/Latino RNs.

Figure A10. Race/ethnicity of Texas population, 2013, RNs, 2013, and new RN graduates, 2013

Education

In order for the supply of RNs in Texas to meet the demand, it is important to increase the number of new nursing graduates. Over the past five years, the number of NCLEX-RN takers in Texas has been similar to the number of graduates of professional nursing programs in Texas (Figure A11). In 2013 in Texas, 11,069 nursing graduates took the NCLEX-RN and 9,290 passed, for a statewide pass rate of 83.9%.

The National Council of State Boards of Nursing (NCSBN) reports the number of nursing graduates who took and passed the NCLEX-RN in the U.S. In 2011, 142,390 RN candidates across the U.S

passed the exam, with a supply ratio of 45.7 NCLEX passers per 100,000 population. In 2013, Texas reported 9,290 RN candidates passed the exam for a supply ratio of 34.8 NCLEX passers per 100,000 population. The Texas NCLEX-RN pass rate of 83.9% was slightly lower than the national pass rate of 84.3% in 2013. Texas NCLEX-RN pass rates over the past five years closely mirror pass rates nationwide (Figure A12). There was a substantial drop in the pass rate in 2013, because the NCSBN raised the passing standard for the exam.

Figure A11. Texas RN graduates and Texas NCLEX-RN takers, 2009-2013

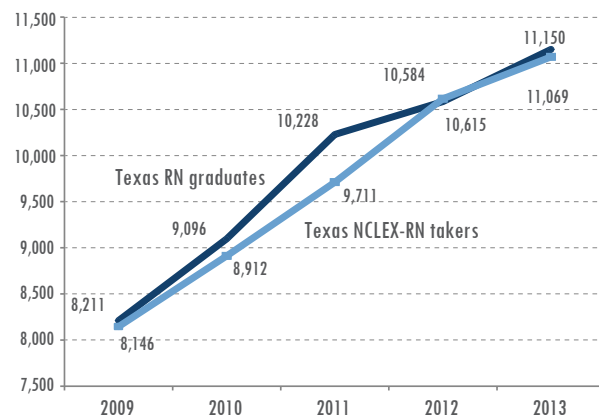

Figure A12. NCLEX-RN pass rates, US and Texas, 2009-2013

Source: Texas BON, 2013

Enrollment in pre-licensure nursing programs has increased constantly from 14,845 in 2003 to 24,178 in 2013. In 2013, the most common basic nursing degree for Texas RNs was an associate's degree (49%), followed by the bachelor's degree (39.6%). Only 10.8% of RNs reported a diploma as their basic degree, 0.4% listed a master's degree, and 0.1%

listed a Vocational Nursing certification. The most common highest degree was the bachelor's in nursing (42%), followed by the associate's degree (40.8%). 9.6% of RNs reported holding a master's degree as their highest degree, 7% reported a Diploma, and only 0.6% listed a doctoral degree in nursing.

Since 2001, the proportion of RNs who go on to receive higher degrees than their basic degrees has increased (Figure A13). 17.7% of RNs whose basic degree was a diploma or associate's degree had a higher degree in 2013, as opposed to 15.4% in 2001. 15.8% of RNs whose basic degree was a bachelor's degree had a higher degree in 2013, as opposed to 11.5% in 2001. 2.7% of RNs whose basic degree was

Figure A13. Academic progression of RNs by their basic level of education

a master's degree had a doctorate in 2013, as opposed to 0.9% in 2001.

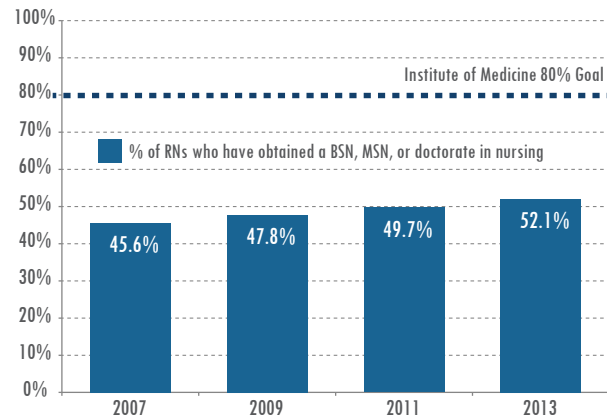

The Institute of Medicine (IOM) has addressed the high demand for nurses by issuing The Future of Nursing: Leading Change, Advancing Health report in 2011 with recommendations for nursing "to address the increasing

demand for safe, high-quality, and effective health care services." Among their recommendations was a charge to increase the proportion of nurses with at least a baccalaureate degree to 80% by 2020. As of 2013, 52.1% of RNs held a baccalaureate degree in nursing or higher, up from 45.6% in 2007 (Figure A14). The number has increased steadily since 2007, but the current rate of increase is not great enough to reach the IOM's goal.

Since 2001, the proportion of RNs who go on to receive higher degrees than their basic degrees has increased.

Another recommendation of the IOM report was a charge to double the number of nurses with a doctorate in nursing by 2020. As of 2013, 1,108 Texas RNs (0.6%) held a doctoral degree in nursing, up from 853 (0.5%) in 2011. Over the past two years, the absolute number of RNs that held a doctorate increased by 255, while the proportion increased by 20%. According to the Texas Higher Education Coordinating Board, the number of nurses enrolled in a Doctorate of Nursing Practice program increased

Figure A14. Tracking progress towards the Institute of Medicine's 2011 goal that 80% of RNs are BSN or higher trained by 2020

from 297 in 2010 to 535 in 2013, while the number of nurses enrolled in a PhD program increased from 337 in 2010 to 373 in 2013.

Implementing the IOM recommendations is important for several reasons, including:

- Research indicates that hospitals with a larger percentage of RNs with a BSN or higher providing bedside care have better patient outcomes, including lower risk of patient mortality (IOM, 2011).
- Schools of nursing are reporting a shortage of faculty as a barrier to training all the eligible nursing applicants (TCNWS, 2013). These positions require at least a Master's in Nursing.
- The Affordable Care Act is projected to provide insurance to 32 million previously uninsured citizens by 2014. This will create an increased need for staff in primary care; however, physicians are going into primary care at lower rates. Nurse practitioners, who require a BSN and graduate level training, can help fill the gap (IOM, 2011).

Unfortunately, research shows that the majority of

ADN-educated RNs in Texas do not obtain a BSN. Only 14% of initially ADN-trained RNs eventually earned a BSN, 1.2% completed an MSN, and 0.1% completed a doctoral degree in nursing. However, 14.9% of initially BSN educated RNs eventually obtained a Master's and about 0.9% achieved a doctorate degree. Among initially trained MSN

Figure A15. Highest nursing degree by age category among RNs, 2013

students, 2.7% later earned their doctorate in nursing (Figure A13). Figure A15 shows that in 2013, RNs aged 21-30 were more likely to have a BSN or higher degree than those aged 31 and older.

The following actions have been recommended in order to help RNs advance through the education pipeline (IOM, 2011):

- Community colleges and universities should adopt enhanced articulation agreements to facilitate ADN's advancing to a BSN degree.
- Pre-nursing curricula should be standardized to help remove barriers to academic progression.
- Accelerated nursing programs should be implemented to minimize the amount of time RNs have to be out of the workforce to obtain additional education.

The Consortium for Advancing Baccalaureate Nursing Education in Texas (CABNET) has begun acting on these recommendations by recruiting community colleges and universities to adopt standardized general education and prerequisite curriculum. This shared curriculum is expected to foster a wider network of articulation agreements that facilitate ADN to BSN academic progression. The number of post-licensure

RN to BSN graduates in Texas has increased constantly from 701 in 2007 to 3,101 in 2013 (TCNWS, 2013). In 2012, Texas received an Academic Progression in Nursing (APIN) Grant to implement the CABNET curriculum (Cunningham, 2012). The grant project emphasizes partnering with clinical sites to develop and assess competencies related to leadership, cultural competencies, interprofessional collaboration, and quality and safety. The grant will also focus on increasing the numbers of minority ADN educated RNs who complete a BSN program. This program has been linked to lower mortality attributed in part to higher quality nursing care (Lundmark et al., 2012) as well as significant economic returns on investment (Drenkard et al., 2010).

Employment Characteristics

The job outlook for RNs is very good. U.S News & World Report ranked registered nurse as the number six best job in 2014 due to low unemployment rates, employment growth, and job prospects (U.S News & World Report, 2014). The BLS ranked RNs in the top 30 occupations with the most job growth, with employment expected to grow by 19.4%

Table A3. Actively practicing RNs in Texas by employment field, 2013

Employment Field	# RNs	% RNs
Inpatient Hospital Care	112,241	58.5%
Home Health Agency	13,442	7.0%
Outpatient Hospital Care	13,404	7.0%
Other*	12,539	6.5%
Physician or Dentist/Private Practice	7,367	3.8%
School/College Health	6,669	3.5%
Nursing Home/Extended Care Facility	5,817	3.0%
Business/Industry	4,446	2.3%
Freestanding Clinic	4,224	2.2%
Community/Public Health	3,670	1.9%
School of Nursing	3,160	1.6%
Self-employed/Private Practice	1,943	1.0%
Military Installation	1,570	0.8%
Temporary Agency/Nursing Pool	753	0.4%
Rural Health Clinic	520	0.3%

*“Other” is a catch-all category for nurses who don’t identify with any other employment field categories.

between 2012 and 2022 (BLS, 2013). Additionally, the Texas Workforce Commission (TWC) estimates that employment of RNs in Texas will increase by 33.1% between 2010 and 2020 (TWC, 2014).

Employment Setting

The 196,571 actively employed RNs in Texas in 2013 were employed in a variety of settings, although a majority (65.5%) were working in hospitals (Table A3). The others were primarily employed in home health (7.0%), “other” fields (6.5%), or physician or dentist private practice (3.8%). The distribution of employment setting has remained almost the same since 2001, although the proportion of RNs employed in outpatient hospital care increased from 4.5% to 6.8% and the proportion employed in physician or dentist private practice decreased from 5.1% to 3.7%.

Position Type

Since the majority of RNs worked in hospitals in 2013, most were employed in hospital-related positions, such as staff nurse or general duty nurse (Table A4). Head nurses or assistants decreased from 7.3% of nurses in 2001 to 4.8% in 2013, while staff/general duty nurses increased from 56.6% of nurses in 2001 to 59.2% in 2013. Supervisors or assistants also decreased from 8.9% of nurses in 2001 to 6.1% in 2013.

Specialty

The most common specialty areas for actively employed RNs were also primarily hospital-related – medical/surgical, intensive/critical care, operating/recovery care, and obstetrics/gynecology (Table A5). The distribution of specialty areas has remained almost constant since 2001. For more information on the geographic distribution of RNs by the top 5 specialties, see Appendix B, Figures F1-F5.

Demographics by setting

The median age of RNs varied among the top five employment fields. Inpatient hospital care employed the youngest RNs with a median age of 43 years. Comparatively, the median age among RNs working at a home health agency was 48, the median age of RNs in outpatient hospital care was 48, and the median age of RNs working in physician or dentist private practice was 58 years.

Fewer RNs in home health agencies and private practice reported a race of other (5.1% and 4.0%) compared to inpatient (16.0%) and outpatient (10.9%) hospital care. There was a much lower proportion of black/African American RNs working in private practice (4.2%) than in all other employment fields.

Table A4. Actively practicing RNs in Texas by position type, 2013

Position Type	# RNs	% RNs
Staff Nurse/General Duty	116,441	65.5%

Anesthesia	2,803	1.5%
Occupational/Environmental	1,201	0.6%

*“Other” is a catch-all category for nurses who don’t identify with any other specialty categories.

Conclusion

Demand for RNs will continue to grow in Texas in the next several years, and the state faces challenges in meeting this demand. The supply ratio of RNs in Texas lags behind the US and comparable states. The workforce is aging, leading to a need to recruit new RNs and retain currently active ones. Rural and border areas of the state have a greater need for healthcare providers but a smaller supply ratio of RNs than metropolitan and non-border areas.

Advanced Practice Registered Nurses

APRNs

Advanced practice registered nurses (APRNs) are registered nurses who have undergone graduate-level training from an accredited education program in one of four APRN types: certified registered nurse anesthetists, certified nurse-midwives, clinical nurse specialists and nurse practitioners and in at least one of six population foci: family/individual across the lifespan, adult-gerontology, pediatrics, neonatal, women’s health/gender-related or psych/mental health (NCSBN, 2008). The APRN has advanced clinical knowledge and skills that have prepared him/her to provide direct and indirect care to patients with greater role autonomy. In Texas, APRNs must pass a national certification exam and obtain a license from the BON in order to practice in Texas in this expanded role.

2013 Texas Advanced Practice Registered Nurse Facts:

White/Caucasian	72.4%
Black/African American	9.1%
Hispanic/Latino	11.0%

Non-border Metropolitan	56.4
Border Non-metropolitan	19.3
Non-border Non-metropolitan	33.5

Supply

Compared to the United States as a whole, and comparable U.S. states, Texas reports a smaller supply of some types of APRNs per 100,000 population. As discussed in the RN section of this report, the need for additional nurses is likely to occur as demand for health care services continues to increase due to the full implementation of the Patient Protection and Affordable Care Act (PPACA) in 2014 (Holahan, Buettgens, Carroll, & Dorn, 2012), an aging population, and an increase in the prevalence of chronic disease. Additionally, the shortage of primary care physicians has been cited as a potential driver of increased demand for other primary care providers such as APRNs and especially nurse practitioners (Green, Savin, & Lu, 2013; Iglehart, 2013; Murphy, 2011).

The data for APRNs were obtained from the HPRC. The HPRC collected and cleaned the data from the BON 2013 RN master re-licensure file and the BON 2013 APRN master licensing file. The APRN category variable in the APRN master licensing file has values for the four APRN types: certified registered nurse anesthetists, certified nurse-midwives, clinical nurse specialists and nurse practitioners. A nurse may be certified as more than one APRN type.

It is important to note that the method for counting APRNs in Texas has been updated and reported numbers may be different than in past reports. The method of counting APRNs was updated for years 2007 to 2013. Comparisons of current numbers with past reports are not recommended.

As of 2013, there were 17,228 active Texas APRN licenses held by 16,200 active APRN individuals (Table B1). Note that nurses may be licensed in more than one APRN role (nurse anesthetist, nurse-midwife, clinical nurse specialist, or nurse practitioner) and they may hold more than one specialization within an APRN role. In 2013, 13,861 APRNs were also licensed as Texas RNs. Demographic data is only available on this subset of APRNs.

The 2013 supply of 16,200 active APRNs in Texas represents a considerable increase from years past, as shown in Figure B1. The trends indicate that the absolute number of APRNs in Texas has grown at a faster rate each year, with overall growth of 50.9%

Table B1. Supply of APRNs in Texas, 2013

2013 Texas Supply of Advanced Practice Registered Nurses	
Active APRN licenses in Texas	17,228
Active APRN individuals in Texas	16,200
Active APRNs in Texas with an active Texas RN license	13,861

Note: APRNs were classified as active if the HPRC 2013 APRN master licensure file indicated that their APRN license status was “Current,” “Current (Recent Approval),” or “Current (Stipulated Approval).” APRNs were classified as working in Texas if the HPRC 2013 RN master re-licensure file indicated that their primary practice state (or mailing address state if practice address was not available) was Texas. APRNs were classified as active APRNs in Texas with a Texas active RN license if the HPRC RN re-licensure file indicated that their RN license status was “Current,” “Current (Notified for Renewal),” or “Current (Processing Renewal).”

Figure B1. Number of APRNs in Texas, 2007-2013

among all APRNs and 53.8% growth among APRNs with an active Texas RN license from 2007 to 2013. These growth rates were much faster than the general Texas population growth rate from 2007 to 2013 (12.4% growth).

The supply ratio of APRNs has also steadily increased over the past six years. The 2013 supply ratio of all APRNs was 60.8 APRNs per 100,000 population in Texas, representing an increase of 34.2% since

The supply of APRNs has steadily increased over the past six years.

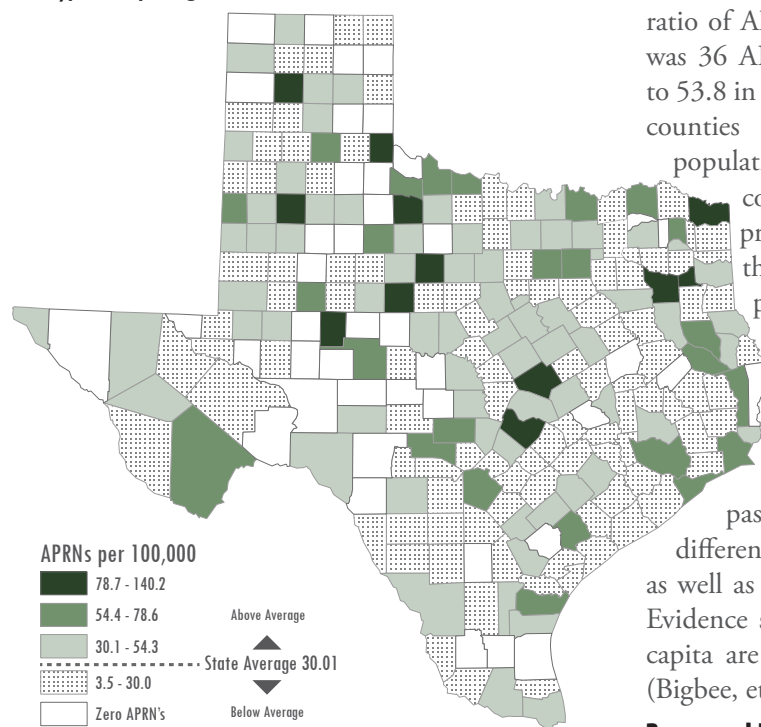

Figure B2. APRNs per 100,000 population in Texas, 2007-2013

2007, as shown in Figure B2. APRNs with an active Texas RN license also increased steadily over the past six years (36.9%).

The most recent data available for comparison with other states was from 2011. The 2011 Texas supply ratio of 53.2 APRNs per 100,000 was lower than the ratio of 58 APRNs per 100,000 reported by California in 2011 (Center for the Health Professions at the University of California, San Francisco, 2011) and the ratio of 75 reported by Florida in 2011.

Figure B3. APRNs per 100,000 population by practice county, Texas, 2013

While the number of APRNs has increased, the supply of APRNs varies across different regions (Figure B3). Figure B3 shows how much the supply of APRNs per capita in each county differs from the average state supply ratio (35.0). Since 2007, 169 of Texas' 254 counties have seen an increase in the

supply ratio of APRNs and 56 have seen a decrease in the supply ratio of APRNs. 159 counties experienced an increase in the absolute number of APRNs practicing in the county since 2007, 94 of which were non-metropolitan counties. There were no practicing APRNs in 42 counties in Texas as of 2013.

There are also differences in the supply of APRNs between metropolitan and non-metropolitan counties, as well as between counties located along the Texas-Mexico border and non-border counties, as shown in Table B2. The supply ratio of APRNs in border counties was 36 APRNs per 100,000 population, compared to 53.8 in non-border counties. In non-metropolitan counties there were 31.7 APRNs per 100,000 population, compared to 54.7 in metropolitan counties. Only 7.1% of Texas APRNs were practicing in non-metropolitan counties; those counties contained 11.7% of the Texas population. Eight border counties and 42 non-metropolitan counties experienced a decrease in the supply ratio of APRNs from 2007 to 2013. There has been some improvement in the supply of APRNs in border counties and rural areas over the past six years but there is still a considerable difference between rural and metropolitan areas, as well as between border and non-border counties. Evidence shows that greater numbers of nurses per capita are associated with better population health (Bigbee, et al., 2014).

There were no practicing APRNs in 42 counties in Texas as of 2013.

Demographics

As discussed in the RN section, one of the goals of the US Department of Health and Human Services' Healthy People 2020 is to reduce health disparities related to gender and ethnicity. A nursing workforce that better mirrors the population it serves will lead to the delivery of culturally appropriate services and

Table B2. Supply of APRNs by county designation, 2007-2013

County Designation	# APRNs, 2007	# APRNs, 2013	APRNs per 100,000 population, 2007	APRNs per 100,000 population, 2013
Border Counties	675	1,001	27.1	36.0
Non-Border Counties	8,337	12,860	39.3	53.8
Metropolitan Counties	8,273	12,875	40.0	54.7
Non-metropolitan Counties	739	986	24.3	31.7

reduced health disparities. Overall, demographics among APRNs have been changing slowly. APRNs are more diverse than RNs in terms of the male to female ratio, but less diverse than RNs in terms of race/ethnicity. Although the median age of APRNs has decreased slightly over the past few years, the aging of the APRN workforce is still of concern.

Sex

As in years past, in 2013 there was a higher representation of males among APRNs (18.2% male) than among RNs (11.4% male). The proportion of APRNs who were female remained the same over the past two years; in 2013, 80.5% of APRNs were female compared to 81.8% in 2011. Since 2007, the percentage of males has increased from 16.2% to 18.2%, a 12.5% increase.

There was a higher representation of males among APRNs (18.2% male) than among RNs (11.4% male).

Age

The aging of the APRN workforce is still a concern in Texas. As described by Buerhaus, et al. (2013), in 2011, the oldest members of the baby boom generation reached the age of 65, and in 2014, the youngest members of the baby boom generation turn 50. More than half of baby boomers will be eligible for retirement by 2020, which could result in an outflow of nurses from the workforce.

In 2013, 40.5% of APRNs were 50 years or older. Texas also had a small proportion of APRNs under 35 years of age (15.3%). However, the proportion

of APRNs under 35 years of age has increased from 13.1% in 2007, a 16.8% increase. Likewise, since 2010, the number of graduates from APRN programs has increased each year. An increasing proportion of younger APRNs and an increasing number of APRN graduates could help alleviate the gap left by older nurses when they retire and reduce the impact of a mass outflow of older nurses.

As shown in Figure B4, there was a large bulge of APRNs between 50 and 65 years of age. This group represents the baby boom generation that may be retiring in the next decade as discussed previously. However, the figure also shows that there is a second bulge of APRNs between the ages of 30 and 45. These younger nurses may help to fill the gap that retiring baby boomer nurses will leave as they exit the workforce.

The median age of APRNs is slowly decreasing. The median age remained steady at 49 years from 2007 to 2010, decreased to 48 years in 2011, and decreased to 47 years in 2013. As in years past, male APRNs were slightly younger (median age of 46 years) than female APRNs (median age of 47 years), though the difference in mean age was not statistically significant. Additionally, the age and sex of APRNs varied somewhat by the area in which they practiced. There was a statistically significant difference between the age of APRNs who worked in metropolitan counties and those who worked in non-metropolitan

Figure B4. Age and sex of APRNs, 2013

counties ($F(1, 13859) = 13,861 = 82.8, p < .001$). APRNs who worked in metropolitan counties had a median age of 46 years and those who worked in non-metropolitan counties had a median age of 51 years. A significantly larger proportion of APRNs working in border counties were male (27.7%) compared to those working in non-border counties (17.5% male) ($\chi^2(1, N = 13,636) = 39.9, p < .001$). Likewise, a significantly larger proportion of APRNs in non-metropolitan counties were male (25.8%) compared to metropolitan counties (17.6%) ($\chi^2(1, N = 13,636) = 63.7, p < .001$).

Race/Ethnicity

The APRN workforce is slowly becoming more diverse. As shown in Figure B5, the majority of APRNs were white/Caucasian (72.4%); however, there has been a steady decrease since 2007 when 83.2% of APRNs were white/Caucasian. The percentage of APRNs that were black/African American has increased by 3.6 percentage points since 2007. The percentage

Figure B5. Race/ethnicity of APRNs, 2007-2013

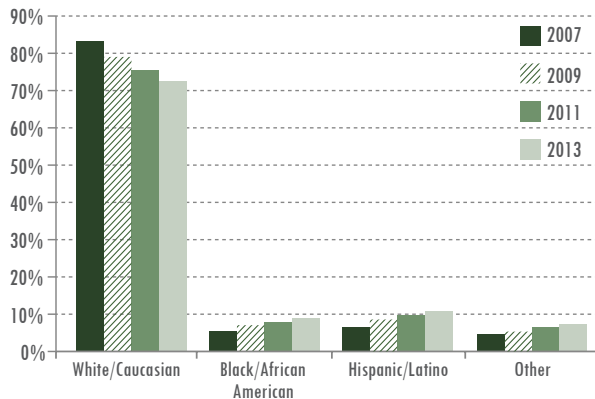

Figure B6. Race/ethnicity among APRNs, 2013, APRN graduates, 2013, and the Texas population, 2013

of APRNs that were Hispanic/Latino continued to increase in 2013 (11%) compared to 2007 (6.6%). The other race category, which includes Asian, Native Hawaiian/Pacific Islander, and American Indian/Alaskan Native among others, represented 7.5% of APRNs in 2013, up from 4.6% in 2007.

Although the APRN workforce is slowly diversifying, the racial/ethnic makeup of the workforce does not yet mirror the Texas population, as shown in Figure B6. Among APRNs practicing in border counties, 52.3% were Hispanic/Latino compared to 88.3% of Texans living in border counties. Compared to RNs, the APRN workforce was less diverse. However, the population of new APRN graduates in Texas in 2013 is slightly more diverse than the current APRN workforce, suggesting that the demographic breakdown of new APRNs is shifting toward that of the Texas population.

Among APRNs practicing in border counties, 52.3% were Hispanic/Latino compared to 88.3% of Texans living in border counties.

Education

As of January 1, 2003, nurses were required to obtain a master's or higher level degree from an accredited graduate level advanced practice registered nurse educational program in order to become licensed as an APRN (Texas Administrative Code, title 22, rule §221.3). Some currently licensed and active APRNs may not have a master's degree or higher. The BON granted waivers from the master's degree requirement to qualified certificate-prepared nurse-midwives and women's health care nurse practitioners who completed their programs on or after January 1, 2003 through December 31, 2006. Additionally, APRNs

Figure B7. Highest nursing degree of APRNs, 2013

Note: APRNs with less than a Master's degree were certified prior to January 1, 2003 and/or received a waiver from the Master's degree requirement.

Figure B8. Academic progression of APRNs by their basic level of education

who are nurse anesthetists, nurse-midwives, or nurse practitioners and who graduated before January 1, 2003 are exempt from the master's or higher level degree requirement.

As shown in Figures B7 and B8, level of nursing education did not vary greatly among APRNs due to the education requirement implemented in 2003. Most APRNs reported their basic nursing degree as a bachelor's degree (62.5%) or an associate's degree (24.6%). Only 8.3% of APRNs reported a diploma as their basic nursing degree. Regardless of basic nursing degree, 80.7% APRNs have obtained a master's degree and 4.1% a doctorate in nursing, as shown in Figures B7 and B8. Nursing advocates are focused on growing the future APRN workforce by increasing the number of nurses graduating with advanced degrees. The Institute of Medicine (IOM) issued *The Future of Nursing: Leading Change, Advancing Health* report in 2011 with recommendations for nursing "to address the increasing demand for safe,

Figure B9. APRNs with a doctoral degree, 2007-2013

high-quality, and effective health care services" (IOM, 2011, p. xi). Among those recommendations was a charge to double the number of nurses with a doctorate by 2020. As of 2013, 571 APRNs (4.1%) held a doctoral degree in nursing, up from 402 APRNs (3.4%) in 2011 (Figure B9). Over the past two years, the absolute number of APRNs that held a nursing doctorate rose by 42%, while the proportion increased by 20.6%. If this level of growth continues, the number of APRNs with a nursing doctorate as of 2011 will double by 2015. Some of this growth may be attributed to the increasing number of DNP programs opening. Nationwide, the number of students enrolling in DNP programs increased by 27% and the number of DNP graduates increased by 31.5% from 2012 to 2013 (Rosseter, 2014). According to the Texas Higher Education Coordinating Board, the number of nurses enrolled in a DNP program increased from 297 in 2010 to 535 in 2013.

Over the past two years, the absolute number of APRNs that held a nursing doctorate rose by 42%, while the proportion increased by 20.6%.

Employment Characteristics

The job outlook overall is very good for APRNs. According to the Bureau of Labor Statistics (2014), the projected growth for APRNs is 31% from 2012 to 2022 due to an increase in demand for healthcare services, compared with 11% for all occupations. The BLS states that demand for APRNs will be high, especially in medically underserved areas (MUAs). MUAs are areas or populations designated by HRSA as having too few primary care providers, high infant mortality, high poverty, and/or a high elderly population (HRSA, 1995).

Employment Characteristics

The job outlook overall is very good for APRNs. According to the Bureau of Labor Statistics (2014), the projected growth for APRNs is 31% from 2012 to 2022 due to an increase in demand for healthcare services, compared with 11% for all occupations. The BLS states that demand for APRNs will be high, especially in medically underserved areas (MUAs). MUAs are areas or populations designated by HRSA as having too few primary care providers, high infant mortality, high poverty, and/or a high elderly population (HRSA, 1995).

Employment Setting

APRNs worked in a variety of employment settings in 2013 (Table B3).

Of the 13,670 APRNs for which we have employment data, most worked either in inpatient or outpatient hospital care (47.7%) or in a physician or dentist private practice (19.7%). This represents little change over the past six years.

Prescriptive Authority

According to Texas Medical Board (TMB) Rule 193.6, physicians may delegate ordering and prescribing nonprescription drugs, prescription drugs

Table B3. Actively practicing APRNs in Texas by employment field, 2013

Employment Setting	Number of APRNs	Percent (%) of APRNs
Inpatient Hospital Care	5,130	37.5%
Physician or Dentist/Private Practice	2,696	19.7%
Outpatient Hospital Care	1,389	10.2%
Other*	812	5.9%
Freestanding Clinic	774	5.7%
Self-employed/Private Practice	618	4.5%

Nursing Home/Extended Care Facility	244	1.8%
School/College Health	181	1.3%
Business/Industry	119	0.9%
Home Health Agency	101	0.7%
Temporary Agency/Nursing Pool	19	0.1%

*“Other” is a catch-all category for nurses who don’t identify with any other employment field categories.

and medical devices (legally designated as “dangerous drugs”), and durable medical equipment to an APRN. The physician may also delegate prescribing and ordering some controlled substances to APRNs, with some limitations (Coalition for Nurses in Advanced Practice, 2014). In order to be issued prescriptive authority a nurse must have full licensure from the Texas BON to practice as an APRN and have “filed a complete application for prescriptive authority and submit evidence as required by the BON to verify successful completion of graduate level courses in advanced pharmacotherapeutics, advanced pathophysiology, advanced health assessment, and diagnosis and management of diseases and conditions within the role and population focus area” (Texas Administrative Code, Title 22, Part II, Chapter 222, Rule 222.2). Of the 16,380 active Texas APRNs, 11,664 (71.2%) have active prescriptive authority.

Conclusion

Demand for APRNs will continue to grow in Texas over the next several years, and the state faces

challenges in meeting this demand. The supply ratios of some types of APRNs in Texas lag behind the US and comparable states. Additionally, as the baby boom generation of APRNs moves closer to retirement age, there will be a greater need to recruit new APRNs, especially in rural and border areas. Rural and border areas of the state have a greater need for healthcare providers but currently have a smaller supply ratio of APRNs than metropolitan and non-border areas. The supply of APRNs in Texas should continue to be monitored to ensure adequate coverage.

Although overall, the supply of APRNs is growing, the above data varies considerably by APRN type. In the following section, we examine the trends and demographics by the four APRN roles.

Demographics by setting

APRNs who were self-employed/private practice were the oldest with a median age of 54, followed by those in freestanding clinics (51), outpatient hospitals (48), physician or dentist private practice (45), and inpatient hospitals (43). In all five settings the median age of APRNs has decreased since 2007, with inpatient hospitals seeing the biggest drop from 47 years in 2007 to 43 years in 2013.

Similar to past years, the race/ethnicity of APRNs did not differ considerably among the top five employment settings, although a slightly greater proportion of APRNs working in physician or dentist private practice were Hispanic/Latino (13.3%) when compared to other settings.

Nurse Practitioners

Nurse practitioners (NPs) have been granted authorization by the BON to practice based on their advanced education and experience. Nurse practitioners may be certified in one or more population specialties: Acute Care Adult, Acute Care Pediatric, Adult, Family, Gerontology, Neonatal, Pediatric, Psychiatric/Mental Health, and Women's Health. NPs practice both under the authority of their nursing license and in collaboration with physicians. NPs provide clinical care services including the diagnosis, treatment, and management of acute and chronic diseases, physical examinations and other health screening activities, and health promotion and education. Some functions, such as prescribing medications, can be performed only in collaboration with a physician under written protocols. NPs are certified separately for practice as primary care NPs and acute care NPs. The NP practice emphasizes health promotion and disease prevention and provides health education and counseling in addition to diagnosing and treating patients (American Association of Nurse Practitioners, 2014).

Certified Registered Nurse Anesthetists

Certified registered nurse anesthetists (CRNAs) have been granted authorization by the BON to practice based on their advanced education and experience. CRNAs must graduate from an accredited master's or doctoral education program and pass the certification examination administered by the Council on Certification of Nurse Anesthetists or its predecessor (American Association of Nurse Anesthetists, 2014). CRNAs provide anesthesia in collaboration with surgeons, anesthesiologists, dentists, podiatrists, and other qualified healthcare professionals. In Texas, physician supervision is not required to practice, but the CRNA must have an order from a physician for an anesthetic or anesthetic related service (Texas Association of Nurse Anesthetists, 2013). "Nurse anesthetists care for patients at all acuity levels across the lifespan in a variety of settings for procedures including, but not limited to, surgical, obstetrical, diagnostic, therapeutic, and pain management. Nurse anesthesia practice may include, but is not limited to, these elements: performing a comprehensive history

and physical; conducting a preanesthesia evaluation; obtaining informed consent for anesthesia; developing and initiating a patient-specific plan of care; selecting, ordering, prescribing and administering drugs and controlled substances; and selecting and inserting invasive and noninvasive monitoring modalities." (American Association of Nurse Anesthetists, 2013)

Clinical Nurse Specialists

Clinical nurse specialists (CNSs) have been granted authorization by the BON to practice based on their advanced education and experience. Clinical nurse specialists are certified in one or more population focus areas: adult health/medical surgical nursing, community health nursing, critical care nursing, gerontological nursing, pediatric nursing, or psychiatric/mental health nursing. CNSs practice under the authority of their nursing license and in collaboration with physicians. CNSs are skilled in providing direct clinical care as well as working at the systems level to coordinate clinical care and improve patient outcomes (National Association of Clinical Nurse Specialists, 2013). Additionally, the CNS may focus on nurse management, expert coaching, and/or implementing evidence-based methods (Sparacino, 2005).

Certified Nurse-Midwives

Certified nurse-midwives (CNMs) have been granted authorization by the BON to practice based on their advanced education and experience. CNMs must be licensed as registered nurses and as advanced practice registered nurses by the Texas BON and be authorized to practice as nurse-midwives. The nurse-midwife may provide the full range of primary health care services for women from adolescence beyond menopause. The focus of the nurse-midwife is gynecologic and family planning services, preconception care, care during pregnancy, childbirth and the postpartum period, and the care of the normal newborn during the first 28 days of life, though CNMs may also provide other primary care services (American College of Nurse-Midwives, 2013). The CNM acts independently and/or in collaboration with other health care professionals in the delivery of health care services (Texas BON, 2013).

Supply

The supply of APRNs varied by APRN type. NPs represented the largest group, with 11,070 licensees representing 11,666 NP specializations (due to some NPs holding multiple specialty certificates). CRNAs were the next biggest group, with 3,786 practicing in 2013. There were a total of 1,369 CNS licensees who held a total of 1,383 active clinical nurse specialist licenses in Texas (due to some CNSs holding more than one CNS specialty). Finally, CNMs made up the smallest group of APRNs with 393 active CNMs in 2013.

Table C1. Supply of APRNs in Texas, by type, 2013

Supply of Nurse Practitioners	
Active NP licenses in Texas	11,666
Active NP individuals in Texas	11,070
Active NPs in Texas with a Texas active RN license	9,827
Supply of Certified Registered Nurse Anesthetists	
Active CRNA licensed individuals in Texas	3,786
Active CRNAs in Texas with a Texas active RN license	2,874
Supply of Clinical Nurse Specialists	
Active CNS licenses in Texas	1,383
Active CNS individuals in Texas	1,369
Active CNSs in Texas with a Texas active RN license	1,227
Supply of Certified Nurse-Midwives	
Active CNMs in Texas	393
Active CNMs in Texas with a Texas active RN license	315

As shown in Figure C1, the number of CNSs decreased in 2013 from past years. Overall, there has been a decrease of 51 active CNSs from 2007 to 2013 (3.6% decrease). CNMs have experienced intermittent growth. The number of active CNMs in Texas has started to grow since 2009, and surpassed the 2007 peak of 366 CNMs in 2013 with an overall growth rate of 7.4% from 2007 to 2013. In contrast, the number of active NPs in Texas has grown at a

faster rate each year since 2009, with overall growth of 70.4% from 2007 to 2013. The number of all CRNAs in Texas has grown

The number of active NPs in Texas has grown at a faster rate each year since 2009, with overall growth of 70.4% from 2007 to 2013.

at an average rate of 4.8% per year since 2007, with overall growth of 32.6% from 2007 to 2013.

Figure C1. Number of APRNs in Texas, by type, 2007-2013

The supply ratio of NPs per 100,000 has increased by 51.6% since 2007, as shown in Figure C2. Though the increase was not as large, the 2013 supply ratio of 14.2 CRNAs per 100,000 population in Texas represents an increase of 18% since 2007. In contrast, the supply ratio of CNSs has steadily decreased over the past six years and the 2013 CNM supply ratio represented a decrease of 4.4% since 2007, though the CNM supply ratio increased slightly from 2012 to 2013.

The supply ratio of CNSs has steadily decreased over the past six years and the 2013 CNM supply ratio represented a decrease of 4.4% since 2007.

Figure C2. APRNs per 100,000 population, by type, 2007-2013

The supply ratio of NPs lags behind those of the US, California, and Florida, as shown in Table C2. Similarly, the supply ratio of CNMs in Texas is lower than that of the US as well as California and Florida. In contrast, the supply ratios of CRNAs and CNSs in

Table C2. Comparison of APRN supply per 100,000

	Supply of NPs per 100,000 population	Supply of CRNAs per 100,000 population	Supply of CNSs per 100,000 population	Supply of CNMs per 100,000 population
Texas, 2013	41.5	14.2	5.1	1.5
U.S., 2013	35.9	11.2	-	1.7
California, 2013	-	4.1	1.4	-
Texas, 2011	34.7	13.2	5.4	1.4
California, 2011	39.0	-	-	2.9
Florida, 2011	50.2	13.5	0.4	2.7

Texas are larger than the supply ratios in comparable states.

The proportion of APRNs who were employed full-time was relatively similar across APRN types, as shown in Table C3. CRNAs had the largest proportion of nurses employed full-time (92.7%) while CNMs had the largest proportion employed part-time (16.2%).

Table C3. Employment status of APRNs, by APRN type

	NPs	CRNAs	CNSs	CNMs
Employed Full-Time	85.7%	92.7%	84.8%	83.8%
Employed Part-Time	14.3%	7.3%	15.2%	16.2%

Though the supply of APRNs has been slowly increasing over the past several years, the growth has not been evenly distributed (Figures C4, C5, C6, and C7). Among all four APRN types, the supply ratios are larger in non-border counties than border counties, and larger in metropolitan counties than non-metropolitan counties, as shown in the tables on page 31. Many counties in Texas had no practicing APRNs, as shown in Table C4.

Demographics

Sex

Overall, the proportion of APRNs who are male has increased from 2007 to 2013, though among most APRN types the workforce was predominately female. CRNAs reported the greatest proportion of male nurses (48%). CRNAs were vastly different from other APRN types in sex distribution. Males made up 10.9% of NPs, 8.1% of CNSs, and 0.3% of CNMs.

Table C4. Counties with no practicing APRNs, by APRN type, 2013

APRN Type	Number of counties with no practicing APRNs
NPs	47
CRNAs	118
CNSs	154
CNMs	211

Age

As shown in Figures C8, C9, C10, and C11, each APRN workforce had a cluster of nurses between 50 and 65 years of age. This group represents the baby boom generation that may be retiring in the next decade as discussed previously. However, some NPs and CRNAs also have a cluster of nurses between the ages of 30 and 45. These younger nurses may help to fill the gap that retiring baby boomer nurses will leave as they exit the workforce. Median ages varied among the four APRN types as shown in Figure C3. CRNAs and NPs had a younger median age (46 years) than CNSs (57) and CNMs (51).

CRNAs reported the greatest proportion of male nurses (48%).

Figure C3. Median age by APRN type, 2013

Figure C10. Age and sex of CNSs, 2013

Figure C11. Age of CNMs, 2013

Note: There was one male with no age provided.

Race/Ethnicity

None of the APRN types mirror the Texas population in terms of racial diversity as shown in Figure C12. In 2013, NPs were the most ethnically/racially diverse type of APRN, though they were less diverse than the Texas population and less diverse than the RN and LVN workforces.

Figure C12. Race/ethnicity of APRNs, by APRN type, 2013

Education

As mentioned previously in the general APRN section (page 27), as of January 1, 2003, nurses were required to obtain a master's degree or higher level degree from an accredited graduate level advanced practice registered nurse educational program in order to become licensed as an APRN in Texas (Texas Administrative Code, title 22, rule §221.3).

As shown in Figure C13, the level of nursing education did not vary greatly among the APRN types due to the education requirement implemented in 2003. CRNAs had the largest proportion of nurses with a bachelor's degree or less as their highest degree (28.6%)

Unlike other APRN types, CNSs have been required to complete a master's degree level education since the Texas BON began regulating APRNs in 1980. Therefore, all CNSs held a master's degree or higher as their highest degree in 2013.

Training new APRNs is important to continue the growth of the APRN workforce in order to meet increasing demand for these types of providers. The HRSA reported on the number of NP, CRNA, and

CNM graduates in the US with a compilation of data from the 2012 AACN Annual Survey (Figure C14). The number of NP and CRNA graduates across the US has grown from 2001 to 2011, and in recent years, the Texas NP and CRNA graduates have kept pace with national graduate growth. The production of CNM graduates across the US and Texas has remained relatively steady. HRSA data was not available for CNS graduates.

Figure C13. Highest degree, by APRN type, 2013

Figure C14. HRSA graph of number of U.S. APRN graduates, by type, 2001 - 2011

Employment Characteristics

The job outlook is good for most APRN types. US News & World Report ranked the NP as the number four best job in 2014 due to low unemployment rates among NPs, increased demand for NPs, decent pay, and job autonomy (US News & World Report, 2014). Additionally, the BLS ranked NPs in the top 25 fastest growing occupations, with employment expected to grow by 33.7% from 2012 to 2022 (BLS, 2013). The BLS estimates that CRNA employment

will grow by 31% between 2012 and 2022 and that CNM employment will grow by 31% during the same time period (BLS, 2014).

The job outlook for clinical nurse specialists is difficult to determine. The BLS does not specifically track job growth for CNSs. Registered nurse employment, where CNSs are sometimes included, is projected to grow by 19.4% from 2012 to 2022 (BLS, 2013).

Employment Setting

Employment setting did not vary much among the different APRN types (See Figure B10 in the APRN general section). The most common setting among APRNs was inpatient hospital care. CRNAs had the largest proportion of nurses working in inpatient hospital care (74.4%). CNSs had the largest proportion of nurses working in schools of nursing (15.5%).

Certification Specialties

NPs and CNSs are certified in one or more practice specialties during their advanced practice education. Tables C5 and C6 show the specialties for each APRN type. Please note that NPs and CNSs may hold more

The most common specialty among NPs in 2013 was the family nurse practitioner (53.7%).

than one certification specialty.

The most common specialty among NPs in 2013 was the family nurse practitioner (53.7%), followed by pediatrics (10%), women's healthcare (8.5%) adult (7.6%), and acute care (6.9%). The distribution of NPs among the different NP specialties is similar to the distribution in 2007. In 2007, 47.3% of NPs specialized in family nursing, 14.1% in women's health care, 12.1% in pediatric, 8.3% in adult nursing, and 4.7% in acute care.

The most common specialty among CNSs in 2013 was medical-surgical nursing (25.9%), followed closely by adult nursing (23.9%), then psychiatric/mental health (17.2%), maternal/child health (8.8%), and critical care (5.6%).

The distribution of CNSs among the different CNS specialties has changed somewhat since 2007. In 2007, only 10.9% of CNSs specialized in adult nursing. 30.1% of CNSs specialized in medical-surgical nursing in 2007, 21.3% specialized in psychiatric/mental health, 9.8% specialized in

The most common specialty among CNSs in 2013 was medical-surgical nursing (25.9%)

Table C5. Actively practicing NPs in Texas by specialty, 2013

Specialty	# NPs	% NPs
Family NP	5,946	53.7%
Pediatric NP	1,110	10.0%
Women's Health Care NP	938	8.5%
Adult NP	844	7.6%

Emergency CNS	15	1.1%
Women's Health CNS	5	0.4%
Cardiovascular CNS	4	0.3%

maternal child health, and 4.4% specialized in critical care nursing. For more information on the geographic distribution of NPs and CNSs by the top five certification specialties, see Appendix B, Figures F6-F15.

Prescriptive Authority

Each APRN type must meet the same requirements (described on page 29) to obtain prescriptive authority. Of the 11,070 active Texas NPs, 10,735 (97%) have prescriptive authority, up from 90.2% in 2007. Only 499 out of 1,369 active Texas CNSs (36.4%) have prescriptive authority, up from 20.8% in 2007, while 347 of 393 active Texas CNMs (88.3%) have active prescriptive authority, up from 73.2% in 2007.

According to the Texas BON, in 2013, CRNAs were not required to have prescriptive authority in order to provide anesthesia or anesthesia-related services in the practice setting. If the CRNA is practicing in a setting in which he/she is writing prescriptions, the CRNA must have prescriptive authority obtained through meeting the requirements described on page 29 of this report. Of the 3,786 Texas CRNAs, 312 (8.2%) have active prescriptive authority, up from 3.2% in 2007.

Conclusion

The differences in supply and demographic data among the APRN types are important to consider in determining future workforce demand. As demand for APRNs continues to grow, the state will face challenges. The aging of the CNS workforce, and to a smaller extent, the CNM workforce, is of particular concern, as the number of new nurses entering the workforce is smaller than the number nearing retirement age. The racial/ethnic diversity of each of the APRN types is far from mirroring the Texas population, which raises concerns about cultural competence and linguistic barriers. Additionally, the supply ratios of NPs, CNSs, and CNMs in Texas lag behind the US and some comparable states. Among all four APRN types, rural and border areas of the state have a greater need for APRNs but a smaller supply ratio than metropolitan and non-border areas. The supply of each APRN type in Texas should continue to be monitored to ensure adequate coverage.

Licensed Vocational Nurses

LVNs

Licensed vocational nurses (LVNs) provide nursing care under the direction of an RN, physician, physician assistant, podiatrist, or dentist (BON, 2013). Although the particular procedures LVNs can legally perform are regulated by each state and thus vary somewhat, all LVNs are charged with providing basic care. This typically includes monitoring and reporting patient status, performing tasks such as changing bandages, and attending to the comfort of patients. Though there is some degree of overlap between the scope of practice of LVNs and RNs, LVNs cannot substitute directly for RNs, while RNs can be held responsible for the supervision of LVNs (HRSA, 2004).

2013 Texas Licensed Vocational Nurse Facts:

White/Caucasian	52.6%
Black/African American	22.1%
Hispanic/Latino	22.7%
Other	2.6%
Male	10.9%
Female	89.1%
Median Age	43
Median Age Male	42
Median Age Female	44
Number of Counties with no LVNs	7

Supply of Licensed Vocational Nurses in Texas:

Year	Number	LVNs/100,000 Population
2008	67,103	277.5
2009	69,152	278.0
2010	71,141	280.4
2011	72,921	281.7
2012	73,674	281.8
2013	75,258	282.2

2013 Licensed Vocational Nurses/100,000 Population

Border Metropolitan	243.1
Non-border Metropolitan	261.8
Border Non-metropolitan	339.5
Non-border Non-metropolitan	464.0

Supply

Unlike Texas' RN and APRN workforce, the per capita supply of LVNs in Texas exceeds that of comparable states and the nation as a whole. A greater proportion of LVNs are employed in nursing care facilities at both the state and national level (BLS, 2014) when compared to other nursing professionals, suggesting that increased demand for health care services created

The per capita supply of LVNs in Texas exceeds that of comparable states and the nation as a whole.

by an aging population may be especially relevant to the state of the LVN workforce in the near future. In addition, Texas' supply of LVNs may help to relieve some of the increased demand for RNs. As suggested by Livornese

(2012), LVNs could take some of the burden from RNs working in hospitals by caring for patients with routine care, predictable outcomes, and non-life threatening illnesses. If LVNs are equipped to work fully within their scope of practice, this could help hospitals maximize their workforce. Auerbach et al. (2013) also note that with some emerging models of care such as medical homes and nurse-managed health centers, more LVNs will be needed to deliver proper care. Because the Texas population is currently growing faster than the LVN population, recruitment of new LVNs and retention of current LVNs is crucial in meeting these needs.

According to the 2013 HPRC LVN re-licensure file, there were 97,067 LVNs with active licenses in Texas. Of these, 77,517 were employed full-time or part-time in nursing, and 75,258 were LVNs employed full-time or part-time in nursing in Texas (Table D1).

The 75,258 active LVNs practicing in the state give Texas a supply ratio of 282.2 LVNs per 100,000

population. In 2011, there were 72,921 active LVNs in Texas with a supply ratio of 281.7 LVNs per 100,000 population. The supply ratio of LVNs grew by 0.2% since 2011 and has declined by 2.8% since 2000, when the supply ratio was 290.2. The absolute number of LVNs grew by 3.2% since 2011 and 27.5% since 2000 (See Figure D1). This suggests that the Texas population is growing faster than the population of active and practicing LVNs in Texas.

Although Staiger (2012) looked specifically at RNs, it appears as though the recession also impacted the supply of LVNs in Texas. 13,283 LVNs who reported an employment status of unemployed or retired in

Figure D1. Number of LVNs in Texas, 2002-2013

2007 had returned to the nursing workforce by 2013. Another 3,255 LVNs who had been working in a field other than nursing in 2007 had re-entered the nursing workforce by 2013. However, the proportion of those who report a status of employed in nursing (either full- or part-time) has increased since 2012, with a corresponding decrease in those who report a status of unemployed/retired, suggesting that some LVNs may be leaving the workforce again as the economy recovers.

The proportion of LVNs who were unemployed or retired has increased by 53.4% in the last year, from 5.8% in 2012 to 8.9% in 2013 (Figure D2). This represents a reversal of the trend in which the share of LVNs who were unemployed or retired had been decreasing steadily since 2009. The proportion of LVNs employed in other fields has remained relatively constant.

Since 2001, the proportion of LVNs that were employed in nursing full-time has increased by 3.7%. The majority (87.7%) of LVNs in Texas were

Table D1. Number of LVNs in Texas, 2013

2013 Texas Supply of Licensed Vocational Nurses	
LVNs with active licenses	97,067
LVNs with active licensed working in nursing	77,517
LVNs with active licenses working in nursing in Texas	75,258

Note: Nurses were classified as active if the re-licensure file indicated that their license status was "Current," "Current (Notified for Renewal)," or "Current (Processing Renewal)." Nurses with active licenses may or may not be employed in nursing. Nurses were classified as working in nursing if they indicated that their employment status was "Employed in Nursing Full Time" or "Employed in Nursing Part Time." Nurses were classified as working in Texas if they indicated that their primary practice state was Texas.

employed in nursing full-time (Figure D3).

Figure D2. Employment status of LVNs with active licenses, 2002-2013

Figure D3. Percent of LVNs employed full-time and part-time in nursing, 2002-2013

While the Texas supply ratio of LVNs has declined since the early 1980s, it has remained higher than the national supply ratio and that of comparable states. In Texas, the 2013 supply ratio of 282.2 LVNs per 100,000 exceeded the national supply ratio of 225 LVNs per 100,000 population (HRSA, 2013); the 2011 Florida supply ratio of 266 per 100,000 population (FCN, 2012); and the 2012 California supply ratio of 163 per 100,000 population (CHF, 2014). Texas has maintained a larger supply ratio of LVNs than the US over the last three decades; however, the size of the difference in supply has decreased over time, as shown in Figure D4.

Although the absolute number of LVNs in Texas continues to grow, the supply of LVNs is not distributed evenly across the state (Figure G5). Of the 75,258 actively licensed LVNs employed in nursing in Texas, 73.5% worked in a non-border metropolitan

county.

In contrast to other nursing professions, the supply ratios for LVNs continued to be higher in non-metropolitan counties than metropolitan

Figure D4. LVNs per 100,000 population, U.S. and Texas, 1981-2013

counties. Both border metropolitan and non-border metropolitan areas had supply ratios lower than the rest of the state (Table D2). In 2013, there were seven counties in Texas that had zero practicing LVNs. Since 2000, 118 of Texas' 254 counties have seen an increase in the supply ratio of LVNs. 91 counties experienced a decrease in the absolute number of LVNs practicing in the county, 62 of which were non-metropolitan counties. The supply ratios for LVNs were larger in non-metropolitan counties than metropolitan counties from 1981 to 2013, unlike the supply ratios of RNs and APRNs (Figure D6).

The supply ratios for LVNs continued to be higher in non-metropolitan counties than metropolitan counties.

Table D2. Supply of LVNs by county designation

County Designation	# LVNs	LVNs per 100,000 population
Border counties	7,099	256.4
Non-border counties	68,159	285.2
Metropolitan counties	61,089	259.9
Non-metropolitan counties	14,169	448.9

Demographics

The diversity in the LVN workforce is an important factor in addressing issues of cultural competence

Figure D5. LVNs per 100,000 population by county of practice, Texas, 2013

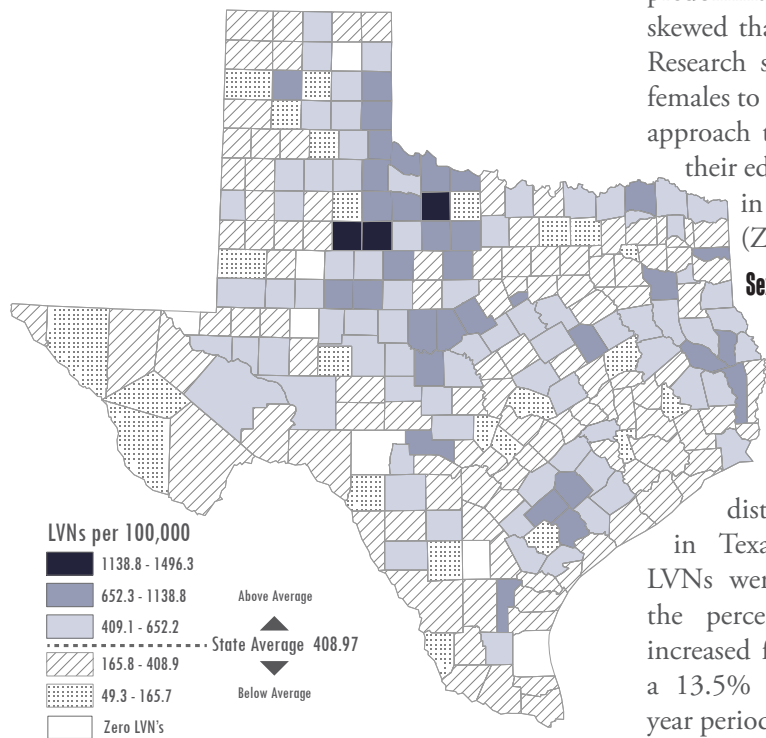

Figure D6. LVNs per 100,000 population, metropolitan and non-metropolitan counties, Texas, 1981-2013

and health disparities in Texas (CDC, 2013). The demographics of practicing LVNs have been changing slowly over the last decade. The LVN population is more diverse in terms of race/ethnicity in comparison to the APRN and RN populations, yet the LVN workforce is still not reflective of the racial/ethnic breakdown of the general Texas population. Additionally, the long term trend towards an aging RN workforce is not observed among LVNs in Texas. Because Hispanics/Latinos in Texas have a younger age distribution, increasing racial/ethnic diversity may help prevent the graying of the workforce

that is observed among RNs. Nursing in general is predominantly female, but LVNs in Texas are more skewed than some of the other nursing professions. Research suggests that males are more likely than females to abandon nursing education, and a targeted approach to recruiting and retaining male LVNs in their educational training could make great strides in addressing potential workforce shortages (Zysberg and Berry, 2005)

Sex

In 2013, the LVN workforce in Texas was predominantly female; only 10.9% of LVNs were male. This represents no marked change from the 2011 sex distribution of LVNs in Texas, when 10.6% of LVNs were male. Since 2007, the percentage of males has increased from 9.6% to 10.9%, a 13.5% increase over the six year period. A greater proportion of LVNs identified as male in border counties (20.1%) when compared to non-border counties (10%). In metropolitan counties, male LVNs comprised 12% of the workforce, but only accounted for 6.3% of the workforce in non-metropolitan counties.

Age

The age distribution of the LVN workforce is somewhat younger than some of the other nursing professions, as seen in Figure D7. Although there is a cluster of LVNs in the 55 to 65 age range that will be eligible to retire soon, the large proportion of LVNs in the mid 30 to 40 age range should help address that eventual loss of nurses

The median age of all LVNs in Texas in 2013 was 43 years. Male LVNs were slightly younger than female LVNs, at a median age of 42 and 44 years, respectively. The median age for males has remained stable since 2007, while the median age for females has decreased by two years in the same interval. There was a difference of one year in the median age between LVNs who worked in metropolitan counties (43 years) and those who worked in non-metropolitan

Demographics by setting

The LVN workforce is more racially/ethnically diverse than APRNs and RNs, but is still not reflective of the Texas population. Hispanics/Latinos are underrepresented among LVNs in Texas.

The home health setting was one of the most diverse, with white/Caucasians accounting for less than half of all LVNs in that setting.

Figure D7. Age and Sex of LVNs, 2013

counties (42 years). Hispanic/Latino LVNs had the lowest median age at 40 years, followed by the “other” race category (41 years), black/African American (44 years), and white/Caucasian (46 years). LVNs who worked in border counties had a considerably younger median age (39 years) compared to LVNs working in non-border counties (43 years).

Race/Ethnicity

The LVN workforce does not currently reflect the racial diversity in the general Texas population, despite increasing racial/ethnic diversity. In the last six years, the proportion of white/Caucasian LVNs has steadily decreased, while the proportions of both black/African American and Hispanic/Latino have increased. Similar to past years, the majority of LVNs were white/Caucasian (52.6%). The proportion of white/Caucasian LVNs has declined since 2007 (58.2%) as shown in figure D8; however, this group was still overrepresented among LVNs when compared to the Texas population. The proportions of black/African American and Hispanic/Latino LVNs were roughly equal, at approximately 22% and both have increased steadily since 2007. Despite growth among these groups, Hispanics/Latinos were still underrepresented among LVNs in 2013. The other race category, which includes Asian, Native Hawaiian/Pacific Islander, and American Indian/Alaskan Native among others, represented 2.6% of LVNs in 2013, down from 3.1% in 2007.

Although the LVN workforce as a whole is more racially/ethnically diverse in comparison to other nursing professions, Hispanic/Latinos are slightly underrepresented among both 2013 LVN graduates and the current LVN workforce. The trends suggest that diversity among the LVN population will continue to increase and is moving toward more closely representing the Texas population (Figure D9); however, it is imperative to recruit and retain Hispanic/Latino students in order to maintain cultural competency among LVNs.

In border areas, Hispanic LVNs comprised an overwhelming majority of the LVN population, at 75.8% of LVNs in non-metro border counties

Figure D8. Race/ethnicity of LVNs, 2007-2013

and 81.5% of LVNs in metro border counties. In non-border areas, whites/Caucasians accounted for three-quarters of the LVN population in non-metro counties and a little over half of the LVN population in metropolitan counties. LVNs that identified as black/African American accounted for the second largest proportion of the LVN population in non-border metropolitan areas.

Figure D9. Race/ethnicity of the Texas population, 2013; LVNs, 2013; and LVN graduates, 2013

Education

In order for the supply of LVNs in Texas to meet the demands of a growing population, it is important to increase the number of new nursing graduates and improve success on the required examination for licensure, the NCLEX-PN.¹ Both the absolute number of enrollees and the number of graduates from LVN pre-licensure programs have been increasing. Between 2006 and 2013, the number of newly enrolled LVN students increased by 10.6%. Moreover, the number of graduates increased from 3,801 in 2003 to 5,235 in 2013.

The majority of LVNs in Texas listed a credential from a VN/PN program as both their basic degree and their highest nursing degree, at 81.2% and 84.5% respectively. The next most common highest degree type was an associate's degree (11.6%).

With the exception of 2011, the number of NCLEX-PN takers in Texas has been higher than the number of LVN graduates in that same year, which may point to a high proportion of test re-takers (Figure D10).

The most recent data available from the Texas BON

¹PN=Practical Nurse; note that VN/PN are interchangeable terms. California and Texas use LVN, while other states use the title LPN.

Figure D10. Texas LVN graduates and Texas NCLEX-PN takers, 2009-2013

show that in 2013 in Texas, 5,401 nursing graduates took the NCLEX-PN and 4,668 passed, for a statewide pass rate of 86.4%.

The HRSA reports on the number of nursing graduates who took and passed the NCLEX-PN in the U.S. In 2011, 60,302 LVN candidates across the U.S. passed the exam, for a supply ratio of 19.4 NCLEX-PN passers per 100,000 population. In 2013, Texas reported 4,668 LVN candidates passed the exam for a supply ratio of 17.5 NCLEX-PN passers per 100,000 population (BON, 2014). In 2013, the Texas NCLEX-PN pass rate of 86.4% was better than the national pass rate of 84.6% in 2013 (BON, 2014). Texas NCLEX-PN pass rates over the past five years show the same general overall trend as that of the national pass rates; however, Texas maintained higher pass rates throughout the time period.

Though a higher proportion of Texas NCLEX-PN takers pass the exam when compared to the nation, Texas is producing fewer passers per capita than at the

Figure D11. NCLEX-PN Pass rates, U.S. and Texas, 2009-2013

national level (Figure D11).

Employment Characteristics

The job outlook for LVNs is quite good. U.S News & World Report ranked LVN as the number 38 best job out of the top 100 jobs and the number 23 best health care job. The BLS ranked LVNs in the top 30 occupations with the most expected job growth, with employment projected to grow by 24.8% between 2012 and 2022 (BLS, 2013). Moreover, the TWC estimates that employment of LVNs in Texas will increase by 27.3% between 2010 and 2020 (TWC, 2014).

Employment Setting

As shown in Table D3, of the 75,258 LVNs who were actively employed in Texas in 2013, more than a quarter were employed in nursing homes or extended care facilities, one-fifth were employed in inpatient hospital care, and roughly another fifth in home health.

Table D3. Actively practicing LVNs in Texas by employment field, 2013

Employment setting	# LVNs	% LVNs
Nursing Home/Extended Care Facility	19,535	27.1%
Inpatient Hospital Care	14,419	20.0%
Home Health Agency	13,997	19.4%
Other*	6,231	8.6%
Physician or Dentist/Private Practice	5,697	7.9%
Community/Public Health	2,442	3.4%
Outpatient Hospital Care	2,045	2.8%
School/College Health	1,683	2.3%
Freestanding Clinic	1,524	2.1%
Business/Industry	1,044	1.4%
Rural Health Clinic	956	1.3%
Military Installation	853	1.2%
Temporary Agency/Nursing Pool	720	1.0%

*“Other” is a catch-all category for nurses who don’t identify with any other employment field categories.

Position Type

Approximately two-thirds of LVNs in Texas reported employment as staff nurse/general duty. The remaining nurses reported the following positions listed in Table D4.

Table D4. Actively practicing LVNs in Texas by position type, 2013

Position type	# LVNs	% LVNs
Staff Nurse/General Duty	45,532	65.4%
Other*	7,744	11.1%
Office Nurse	5,848	8.4%
Head Nurse or Assistant	4,078	5.9%
Supervisor or Assistant	2,921	4.2%
School Nurse	1,530	2.2%
Administrator or Assistant	779	1.1%
Faculty/Educator	407	0.6%
Consultant	307	0.4%
Inservice/Staff Development	209	0.3%
Researcher	180	0.3%
Nurse Midwife	65	0.1%

*“Other” is a catch-all category for nurses who don’t identify with any other position type categories.

Specialty

The differences between RNs and LVNs in employment field are further reflected in vast differences between the two professions with regards to specialty. Geriatrics was the most frequently cited specialty, followed by home health (see Table D5, page 48). For information on the geographic distribution of LVNs by the top five specialties, see Appendix B, Figures F16 through F20.

Conclusion

Demand for LVNs will continue to grow in Texas in the next several years, and the state faces challenges in meeting this demand. Of particular concern is the underrepresentation of Hispanic/Latinos among LVN graduates and the LVN workforce. Lack of representation and the potential impact on the ability to provide culturally competent care has implications for the well-being of the general Texas populace. Language barriers, especially among the aged, may become an increasingly critical area of concern for health providers and health consumers in Texas.

Table D5. Actively practicing LVNs in Texas by specialty, 2013

Specialty	# LVNs	% LVNs
Geriatrics	17,167	24.8%
Other*	10,104	14.6%
Home Health	8,511	12.3%
Medical/Surgical	7,256	10.5%
General Practice	6,733	9.7%
Pediatrics	5,724	8.3%
Community/Public Health	2,804	4.0%

Occupational/Environmental	368	0.5%
Neonatology	285	0.4%
Anesthesia	55	0.1%

*“Other” is a catch-all category for nurses who don't identify with any other specialty categories.

2013 Certified Nurse Aides

CNAs

The National Council of State Boards of Nursing defines a Certified Nurse Aide (CNA) as “a person who is certified to assist with the delivery of direct nursing care to patients [and who] works under the supervision of a nurse.” CNAs in Texas are licensed by the Department of Aging and Disability Services (DADS). They work mainly in Long Term Care (LTC) facilities and do not need a high school diploma or GED to be licensed. CNA trainees must complete a Nurse Aide Training and Competency Evaluation Program (NATCEP) consisting of at least 16 hours of introductory coursework before they have contact with patients. DADS-approved programs must provide at least 100 hours of training, including 60 hours in the classroom and 40 hours of hands-on training in a nursing facility. Training areas include: communication and interpersonal skills; infection control; safety and emergency procedures, including the Heimlich maneuver; promoting a resident’s independence; respecting a resident’s rights; basic nursing skills, such as measuring temperature, blood pressure, height, and weight; personal care skills, such as dressing and undressing patients, giving baths, and brushing teeth; mental health and social service needs; care of cognitively impaired residents; and basic restorative services. The competency evaluation must include a skills evaluation and a written or oral examination. Currently there are 802 NATCEP training providers and 71 approved in-service education programs for CNAs in Texas.

CNAs are regulated by the Omnibus Budget Reconciliation Act of 1987 (OBRA 87). This Act established the required training areas and number of required training hours for a NATCEP to be approved by states. The Act also mandated that each state create a registry of Nurse Aides.

2013 Texas Certified Nurse Aide Facts:

Median Age	36
Number of Counties with no CNAs	3

Supply of Certified Nurse Aides in Texas:

Year	Number	CNAs/100,000 Population
1997	95,223	493.2
2000	86,522	425.3
2003	105,068	481.3
2006	115,842	493.7
2007	116,669	491.7
2009	121,585	488.8
2011	135,092	537.2
2013	135,983	510.0

2013 Certified Nurse Aides/100,000 Population

Border Metropolitan	456.1
Non-border Metropolitan	463.7
Border Non-metropolitan	592.2
Non-border Non-metropolitan	905.8

Supply

According to the DADS licensure file for 2013, there were 135,983 CNAs in Texas. The 135,983 CNAs give Texas a supply ratio of 510 CNAs per 100,000 population. The Texas supply ratio has decreased by 2.3% since 2011 but has increased by 19.9% since 2000 (Figure E1).

In 2013, 72.2% of CNAs were located in metropolitan border counties, 18.1% were located in non-metropolitan non-border counties, 8% were located in metropolitan border counties, and only 1.7% were located in non-metropolitan border counties (Figures E2 and E3).

The distribution of age among CNAs is shown in figure E4. The majority of CNAs (60.5%) were under the age of 41 years, and the median age of CNAs in 2013 was 36 years.
