

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

The purpose of this document is to provide authority for specific acts of tuberculosis (TB) clinical services described by the TB and Hansen’s Disease Unit and under the authority of Rule Title 22, Texas Administrative Code §193.2, Standing Delegation Orders.

Standing delegation orders (SDOs) and standing medical orders (SMOs) are written instructions, orders, rules, regulations or procedures prepared by a physician. SDOs provide authority and a plan for use with patients presenting themselves prior to being examined or evaluated by a physician. SMOs provide authority and direction for the performance of certain prescribed acts for patients which have been examined or evaluated by a physician. SDOs and SMOs are distinct from specific orders written for a particular patient. The Texas TB Work Plan should be used as a companion to this SDO in order to ensure all patient care standards are met. The intended audience for these orders is authorized licensed nurses working in local health departments providing TB services, and in Texas Department of State Health Services (DSHS) Public Health Regions.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

Standing Delegation Orders

A. Definitions

1. Authorized Licensed Nurse: an employee or contractor of the Texas Department of State Health Services in a nursing position who has met the requirements of and signed this SDO.
2. Authorizing Physician: a physician licensed by the Texas Medical Board who executes this SDO.
3. Licensed Healthcare Provider: a licensed healthcare provider (physician assistant, advanced practice nurse, physician) who is responsible for the care of the patient. The licensed healthcare provider may be another provider who is providing care for the patient in the medical community or it may be the authorizing physician, if the patient does not have another provider.

B. Method Used for Development, Approval, and Revision

This SDO and the relevant attachments shall be:

1. Developed by the TB and Hansen’s Disease Unit.
2. Reviewed, updated, and signed at least annually by the authorizing physician who may re-name these Standing Delegation Orders for local use and write any additional orders, provide clarification or include updates as needed to reflect local practice, with the standards outlined in this document as the minimum orders.
3. Revised as necessary by the DSHS Infectious Diseases Medical Officer, the Regional Medical Directors, and/or the TB and Hansen’s Disease Unit.
4. Reviewed (and revised as necessary) annually by Heartland National Tuberculosis Center heartlandntbc.org/.

C. Level of Experience, Training, Competence, and Education Required

To carry out acts under this SDO, an authorized licensed nurse must:

1. Be an employee or contractor of the Texas Department of State Health Services.
2. Be currently licensed to practice by the Texas Board of Nursing.
3. Be currently certified in Basic Life Support.
4. Have reviewed, are familiar with, and able to readily access the recommendations within the following documents:

5. Have undergone an initial or continuing evaluation of competence relevant to TB clinical services within 12 months prior to signing and providing TB clinical services under this SDO:
- Initial evaluation of competence is performed by the authorizing physician, the nurse’s supervisor, or clinical designee and consists of completion of 40 hours of continuing education and skills training (including the CDC’s “Self-Study Modules on Tuberculosis” cdc.gov/TB/education/ssmodules/), as approved by the TB program manager, and completion of a mentoring plan facilitated by an experienced TB nurse and/or licensed healthcare provider.
 - The authorized licensed nurse must receive an initial evaluation by the authorizing physician, the nurse’s supervisor, or clinical designee that documents the nurse’s ability to carry out these orders in the customary manner.
 - For authorized licensed nurses whose primary job duties are with the TB program, this training and evaluation of competence must occur within 90 days of employment. For other authorized licensed nurses, this training and evaluation of competence must occur before TB clinical services are independently provided by the nurse.
 - Continuing evaluation of competence is performed annually by the authorizing physician, the nurse’s supervisor, or clinical designee and consists of completion of 16 hours of continuing education and skills training, as approved by the regional or local TB program manager.
 - The authorized licensed nurse must receive an annual evaluation by the authorizing physician, the nurse’s supervisor, or clinical designee that documents the nurse’s ability to carry out these orders in the customary manner.
6. Have reviewed and signed this SDO, **ATTACHMENT 1: Attestation of Authorized Licensed Nurse**, within 12 months prior to providing services under this SDO.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

D. Method of Maintaining a Written Record of Authorized Licensed Nurses A

record of the authorized licensed nurses who complete the required training and demonstrate competence shall be documented and maintained by the nurse's supervisor in the Local Health Department or Public Health Region office.

E. Authorized Delegated Acts

Authorized licensed nurses may evaluate and provide TB clinical services under this SDO to patients who are undergoing evaluation for TB disease or TB infection or are a contact to a confirmed or suspected TB disease case.

It is the intent of all parties that the acts performed under this SDO shall be in compliance with the Texas Medical Practice Act, the Texas Nursing Practice Act, the Texas Pharmacy Act, and the rules promulgated under those Acts.

F. Procedures and Requirements to be Followed by Authorized Licensed Nurses

1. Adhere to all Standard Precautions, including bloodborne and respiratory precautions, when participating in TB clinical services.
2. Utilize interpreter services to facilitate patient and provider communication as it relates to limited English proficient (LEP) patients. DSHS employees may use the service listed on the following website:
online.dshs.internal/languageservices/phone.aspx
3. Establish that the patient requires evaluation for TB disease or TB infection or is a contact to a confirmed or suspected TB disease case.
4. Ensure, to the extent possible, that the patient seen for TB clinical services is, in fact, who the person claims to be.
5. Ensure the patient's consent, in the preferred language of the patient, and signature have been obtained in accordance with agency policy and provide copies of the **DSHS Privacy Notice** and/or applicable signed consent forms.
 - **DSHS General Consent and Disclosure** (L-36), available at:
dshs.texas.gov/rls/pubs/GeneralConsentForm042010.pdf
 - **DSHS Privacy Notice**, available at:
dshs.texas.gov/hipaa/privacynotices.shtm
6. All patients undergoing evaluation for TB disease or TB infection will receive an initial evaluation to consist of:
 - a. A personal and medical history.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- b. An appropriate physical examination.
 - c. An explanation of all test(s) to be performed and the risk and benefits of each one. Provide the opportunity for the patient to ask questions.
 - d. The medical screening as described in **ATTACHMENT 2: Medical Screening**.
 - e. **TB screening tests:** Determine if the patient has had a previous positive TB screening test performed in the United States and if there is written documentation of the results OR if the patient has had previous TB disease and if there is written documentation of the treatment.
 - 1) If not, perform a TB screening test with an interferon gamma release assay (IGRA), either T-SPOT®.TB test or QuantiFERON®-TB Gold Plus, as determined by the licensed healthcare provider; the tuberculin skin test (TST) may be used if patient is unable to receive an IGRA or refuses phlebotomy, as described in **ATTACHMENT 3: TB Screening Tests**, if the patient has no contraindications for the selected TB screening test.
 - 2) If so, do not administer another TB screening test, unless instructed by the licensed healthcare provider. Obtain a copy of the results or treatment and document in the patient's medical record.
 - If the patient has had any past treatment for TB infection, obtain a copy of the treatment, if able, and document in the patient's medical record.
7. Obtain additional diagnostic tests appropriate to the services provided.
- a. **Laboratory Tests:** Determine the need for lab specimen collection, as described in **ATTACHMENT 4: Laboratory Tests (Labs)**. Determine if the patient has had the appropriate lab specimens collected within the last 14 days and if there is written documentation of the results.
 - 1) If not, perform venipuncture and collect specimens in the proper tubes, according to laboratory submission requirements.
 - 2) If so, do not perform venipuncture or collect specimens, unless instructed by the licensed healthcare provider. Obtain a copy of the results and document in the patient's medical record.
 - b. **Chest X-Ray:** Determine the need for a CXR, as described in **ATTACHMENT 5: Chest X-Ray (CXR)**. Determine if the patient has had the appropriate CXR performed within the allowed time frame and if there is written documentation of the results.
 - 1) If not, refer for and obtain CXR within 14 calendar days if the patient has no contraindications for CXR. TB programs with on-site radiograph equipment should obtain a CXR within ten (10) calendar days.
 - 2) If so, do not obtain another CXR, unless instructed by the licensed

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- healthcare provider. Obtain a copy of results (and images, if available, for provider review) and document in the patient's medical record.
- c. **Sputum Collection:** Determine the need for sputum collection, as described in **ATTACHMENT 6: Sputum Collection**. Determine if the patient has had the appropriate sputum collection(s) performed within the allowed time frame and if there is written documentation of the results.
- 1) If not, collect sputum specimens, according to laboratory submission requirements. Otherwise, contact the licensed healthcare provider for instructions.
 - 2) If so, do not collect sputum, unless instructed by the licensed healthcare provider. Obtain a copy of the results and document in the patient's medical record.
8. Label and correctly package specimens, according to shipping requirements and regional or local procedures. Submit specimens to an approved laboratory for processing.
9. Document the following in the patient's medical record:
- All test collection dates, test types, circumstances affecting collection, and results.
 - That all diagnostic test results were reviewed.
10. For patients suspected or confirmed to have TB disease, provide the Order to Implement and Carry Out Measures for a Patient with Tuberculosis ("Control Order" or the TB 410 or equivalent dshs.texas.gov/disease/tb/forms.shtm), signed and dated by the local health authority, for the patient to review at the beginning of treatment, if not provided already.
- Explain the Control Order and risks of violation of the Control Order. Provide the opportunity for the patient to ask questions. Have the patient review and sign the Control Order.
 - Provide a copy of the Control Order to the patient.
 - If the patient has questions the nurse cannot answer, contact the local health authority.
 - If the patient refuses to sign the Control Order, sign and date that the Control Order was given, and that the patient refused to sign it; this serves as documentation in the event the patient violates the order.
 - If the patient violates the Control Order, immediately notify the licensed healthcare provider treating the patient and the local health authority who signed the control order.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

11. For patients suspected or confirmed to have drug susceptible TB disease, implement location-appropriate isolation (home-based or refer to a negative pressure air-borne infection isolation room [AIIR] if in a congregate setting).

a. If the patient has an AFB smear positive specimen, do NOT release from isolation until:

- The patient has three consecutive negative AFB sputum smears, collected in 8- to 24- hour intervals; and
 - has symptomatic improvement; and
 - has been on multi-drug therapy for tuberculosis **for at least the equivalent of two weeks** given as directly observed therapy (DOT); and
 - has been completely adherent with DOT

Once the above criteria are met, the patient may be released from isolation, with the date documented in the medical record.

b. If the patient has never had an AFB smear positive sputum or other respiratory specimen, do NOT release from isolation until:

- The patient has three consecutive negative AFB sputum smears, collected in 8- to 24- hour intervals; and
 - has symptomatic improvement; and
 - has been on multi-drug therapy for tuberculosis for **at least 5 days** given as directly observed therapy (DOT); and
 - Has been completely adherent with DOT.

Once the above criteria are met, the patient may be released from isolation with the date documented in the medical record.

c. If the patient has positive AFB sputum smears and the last two consecutive sputum specimens return AFB culture negative, they may be released from isolation if they meet the following criteria (even if they remain smear positive, as these likely represent dead organisms):

- have symptomatic improvement; and
- have been adherent with multi-drug therapy for tuberculosis given as directly observed therapy (DOT).

12. Before medications are administered or provided to the patient, send all pertinent clinical information to the licensed healthcare provider for review. Ensure there is a current order for medication and include when medications are held and need to be restarted.

For verbal or telephone orders, or for telephonic reporting of critical test results, verify the complete order or test result by recording the complete

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

order or test result in the patient's medical record and "reading-back" the complete order or test result. Receive confirmation from the licensed healthcare provider who gave the order or received the test result.

All verbal or telephone orders should be reviewed and countersigned or confirmed by written communication as soon as possible, ideally within one week.

13. The authorized licensed nurse shall review the most recent TB medication regimen ordered by the licensed healthcare provider, a copy of which is placed in the medical record, ensuring that an updated medication consent form is updated in the chart as needed
 - a. Verify appropriate weight-based dosage calculations for all patients. For purposes of dosage calculations and treatment regimen selection, a patient is considered a child if the patient is less than 18 years old and should receive pediatric weight-based dosing of medications as described in **ATTACHMENT 7: Medications.**

14. Determine whether the patient is taking medications that interact when used with the prescribed TB medication regimen. Seek out/consult with a trusted drug information source (e.g., DSHS Library access to "Facts and Comparison," DSHS pharmacist, prescribing licensed healthcare provider) to verify possible medication interactions.
 - a. If so, do not administer or provide medications. Notify the licensed healthcare provider for instructions.
 - b. If not, administer (for directly observed therapy (DOT)) or provide (for self-administered therapy) medications consistent with the most recent licensed healthcare provider order.
 - 1) If medications are to be administered by **DOT**, verify the medications administered are the same as the medications ordered, provide the DOT packet(s) to the patient, and observe the patient ingesting all prescribed medication in each DOT dose packet.
 - 2) If medication(s) are to be **self-administered** by the patient, complete the medication label and provide the medication(s) to the patient.
 - i. As required by the Texas State Board of Pharmacy (Rule Title 22, Texas Administrative Code §291.93), the following information will be pre-printed on the medication label for self-administered medications:
 - The name, address, and telephone number of the clinic
 - The name and strength of the drug - if generic name, the name of the manufacturer or distributor of the drug
 - Quantity

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- Lot number
 - Expiration date
- ii. The authorized licensed nurse will complete the labeling directions so that it contains the following information:
- The patient's name
 - Date medication is provided
 - The physician's name
 - Directions for use (per Texas State Board of Pharmacy rules, incomplete directions for use may be present and if so, are to be completed by the authorized licensed nurse at time of provision)

See sample label:

- 3) Counsel the patient regarding possible side-effects, conditions under which medications should be stopped and the clinic contacted, and the need to prevent pregnancy, if applicable.
- 4) Provide patient with a Patient Education Sheet outlining the uses of the drug(s), potential side effects, and other precautions.
- 5) Document on Medication Provision Log patient's name or initials, drug(s) given (name, strength, quantity), and initials of nurse providing the medications;
- 6) The initial dose of each new TB medication should be given by an authorized licensed nurse with emergency supplies readily available, when possible. The patient should remain for 30 minutes for observation of adverse reactions. Document how long the patient was observed.

15. The following *must* be provided via DOT until completion of therapy:

- a. All regimens for TB disease

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- b. Intermittent regimens for TB infection (self-administration may be considered on select patients for 3HP; see **ATTACHMENT 7: Medications**).
- c. All treatment for TB infection for contacts to multi-drug resistant (MDR)-TB, pre-extensively drug-resistant (pre-XDR) TB, or extensively-drug resistant (XDR)-TB

DOT for TB infection is *highly recommended* for the following:

- children less than 5 years old

16. If any of the following is true, contact the licensed healthcare provider. Do not initiate treatment until additional orders are given.
- a. The medication prescribed for TB disease or TB infection is not consistent with recommended regimens as described in **ATTACHMENT 7: Medications**.
 - b. The medication prescribed for a patient co-infected with TB disease and HIV infection is ordered to be given twice-weekly.
 - c. The medication prescribed for TB disease or TB infection is not appropriate for the patient's weight and/or age as described in **ATTACHMENT 7: Medications**.
 - d. The medication prescribed for TB disease or TB infection is not consistent with:
 - Available and known drug susceptibilities for TB disease
 - Consult recommendations provided by a DSHS-recognized TB Medical Consultant
 - e. Contraindications or significant drug interactions exist with non-TB medications the patient is currently taking, and the TB medication prescribed.
 - f. Patient is suspected or known to be pregnant.
 - g. Patient has active hepatitis or end stage liver disease.
 - h. Laboratory test results are not within the normal range.
 - i. Patient meets indications for DOT but has been prescribed self-administered medications. Consultation with the authorizing physician must be obtained. An order or progress note in writing from the licensed healthcare provider must be placed in the patient's medical record stating reasons for not providing medications by DOT, as expected by DSHS.
17. Immediately hold treatment and contact the licensed healthcare provider if any of the following occurs. Obtain testing as described in **ATTACHMENT 4: Laboratory Tests** and consult the licensed healthcare provider before restarting any medications.
- a. Aspartate aminotransferase (AST) and/or alanine aminotransferase (ALT),

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- level exceeds three times the upper limit of normal in the presence of symptoms.
- b. AST and/or ALT level exceeds five times the upper limit of normal (with or without symptoms).
 - c. Bilirubin exceeds two times the upper limit of normal.
 - d. Laboratory monitoring results reveal a significant change, *as defined by the licensed healthcare provider*, in white blood cell count, hemoglobin, or platelet count.
 - e. Patient reports symptoms or has signs that could be attributed to medication toxicity.
 - f. Patient is on treatment for TB infection and develops signs or symptoms of TB disease.
18. Notify the licensed healthcare provider for any interruptions of therapy, as defined in **ATTACHMENT 7: Medications**. Interruptions in treatment may have a significant effect on the duration of therapy. Reinstitution of treatment must take into account the bacillary load of the patient, the point in time when the interruption occurred, and the duration of the interruption. In general, the earlier in treatment and the longer the duration of the interruption, the more serious the effect and the greater the need to restart therapy from the beginning.
19. **Determine completion of therapy based on total number of doses administered (allowing for minor interruptions in therapy) - not on duration of therapy alone** - as described in **ATTACHMENT 7: Medications**.
- Every attempt should be made to help patient **not** miss doses. Completion of treatment for initial phase must be documented before the patient is permitted to begin therapy for continuation phase of treatment for TB disease. **Only after the minimum total number of DOT doses has been administered for the initial phase can DOT doses be counted towards the minimum total number of doses administered for the continuation phase.** Drug susceptibility testing should be known before discontinuing medications in the initial and continuation phases.
20. If the authorized licensed nurse has questions or concerns that the licensed healthcare provider is unable to answer, the question or concern should be referred to the regional TB program manager and/or the Regional Medical Director, when applicable. The DSHS TB and Hansen's Disease Unit may also be consulted for further information and direction.

Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services Provided by Authorized Licensed Nurses, Fiscal Year 2022

21. If any of the conditions are met in **ATTACHMENT 9: DSHS-Recognized TB Medical Consultant Indications**, a DSHS-Recognized TB Medical Consultant should be consulted. See dshs.texas.gov/disease/tb/consultants/.

Exceptions may be granted if made by the DSHS Regional Medical Director (RMD). In that case, the RMD must either write the medical orders for the patient or include a signed letter in the patient's medical record that the treatment prescribed meets criteria for adequate therapy. The RMD may also request a consult from a DSHS-Recognized TB Medical Consultant.

- All consults to a DSHS-Recognized TB Medical Consultant should include the specific question to be answered, adequate information regarding the history, physical, and diagnostic test results, and a cc: to the regional TB Program Manager, the Regional Medical Director, and the TB and Hansen's Disease Unit Nurse Consultant(s).

G. Patient Record-Keeping Requirements

TB forms available at: texastb.org/forms

Authorized licensed nurses must accurately and completely report and document each patient visit in a medical record prepared in accordance with local and DSHS policy or regional procedures, which will include:

1. Names of personnel involved in the evaluation and treatment at each visit, including the name of the interpreter (if an interpreter is used).
2. The patient's personal health history, the patient's status including signs and symptoms, and physical examination findings.
3. Actions carried out under these standing orders.
4. Any additional physician orders.
5. Medications administered, prescribed by the physician, or provided to the patient.
6. Patient response(s), if any.
7. Contacts with other healthcare team members (for example, the patient's primary healthcare provider) concerning significant events regarding patient's status.
8. Documentation that the appropriate forms are completed and included in the medical record, and copies, when applicable, are provided to the patient.

H. Scope of Supervision Required

These Standing Delegation Orders give the authorized licensed nurse authority to perform the acts described in the SDOs in consultation with the authorizing physician as needed.

Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services Provided by Authorized Licensed Nurses, Fiscal Year 2022

I. Specialized Circumstances to Immediately Communicate with the Authorizing Physician

Specific circumstances that the authorized licensed nurse providing services under this SDO should immediately contact the authorizing physician by phone include, but are not limited to:

1. Circumstances when medical direction or consultation is needed.
2. Patient has violated the signed *Order to Implement and Carry Out Measures for a Patient with Tuberculosis*.

In an emergency situation, the authorized licensed nurse is to call 911, provide emergency services as authorized in the regional or local emergency SDO, and contact his/her supervisor and/or the authorizing physician by phone as soon as possible.

J. Limitations on Setting

Authorized licensed nurses can provide services under these standing orders in the clinic setting, in the patient’s home, or other field settings when the authorizing physician can be contacted by phone.

K. Date and Signature of the Authorizing Physician

This SDO shall become effective on the date that it is signed by the authorizing physician, below, and will remain in effect until it is either rescinded, upon a change in the authorizing physician, or at the end of business on the last day of the current DSHS fiscal year (August 31, 2022), whichever is earlier.

Authorizing Physician’s Signature:

Fiscal Year 2022**

ATTACHMENT 2: Medical Screening

A. All patients undergoing initial screening for TB disease or TB infection:

1. Undergo a **clinical evaluation** that includes a signs and symptoms screening questionnaire and documentation of medical history.
2. **Screen for tuberculosis** with an approved TB screening test, as outlined in Attachment 3: *TB Screening Tests*. Perform venipuncture and collect specimens in the proper tubes, according to laboratory submission requirements.
3. For patients age 13 years and older, **screen for HIV infection** using an approved laboratory-based HIV immunoassay. For patients younger than 13 years old, screen for HIV infection using an approved laboratory-based HIV immunoassay **if risk factors for HIV infection are present** (including known or self-reporting of: mother with HIV infection and no documentation of child's status; history of blood transfusion outside the United States; history of sexually transmitted infection (STI), sexual activity, pregnancy, intravenous drug abuse).

cdc.gov/healthyouth/data/topics/;

pedaids.org/pages/about-pediatric-aids

- a. Note for testing of patients aged <24 months:
 - HIV infection in infants should be diagnosed using HIV nucleic acid amplification virologic assays. (From: aidsinfo.nih.gov/guidelines/html/3/perinatal/188/initial-postnatal-management-of-the-neonate-exposed-to-hiv)
 - Because children with perinatal HIV exposure aged 18 to 24 months may have residual maternal HIV antibodies, definitive exclusion or confirmation of HIV infection in children in this age group who are HIV antibody-positive should be based on a nucleic acid test. (From: aidsinfo.nih.gov/guidelines/html/2/pediatric-treatment-guidelines/0#)
 - DSHS Laboratory does not perform HIV NAAT testing but can provide guidance where to send the specimen if needed; contact State Serology lab for details: dshs.texas.gov/lab/
- b. If the patient has a previously documented positive HIV test result, HIV testing does not need to be repeated. Obtain a copy of the results and document in the patient's medical record.
- c. If the patient has a documented negative HIV test result from a specimen collected within the last 14 days, HIV testing does not need to be repeated. Obtain a copy of the results and document in the patient's medical record.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

B. All patients undergoing evaluation for TB disease or TB infection, once initially screened and diagnosed:

1. For patients age 13 years or older, **screen for diabetes** using a random plasma glucose.
 - a. If any of the following apply, do not screen for diabetes:
 - If the patient is younger than 13 years old, routine screening is not recommended.
 - If the patient has a previously documented positive diabetes test result, diabetes testing does not need to be repeated. Obtain a copy of the results and document in the patient's medical record.
 - If the patient has been prescribed medication for diabetes, diabetes testing does not need to be repeated. Obtain a copy of the most recent diabetes test results and document in the patient's medical record.
 - If the patient has a documented negative diabetes test result from a specimen collected within the last 14 days, diabetes testing does not need to be repeated. Obtain a copy of the results and document in the patient's medical record.

2. For patients with any of the following risk factors for hepatitis B virus (HBV), **screen for HBV** using hepatitis B surface antigen (HBsAg):
 - All persons born in one of the following high-risk regions:
 - Western Pacific (includes China, Cambodia, Vietnam, the Philippines, Korea)
 - Africa (Democratic Republic of Congo, Ethiopia, Guinea, Kenya, Eritrea, Sierra Leone)
 - Southeast Asia (Bangladesh, Nepal, India, Myanmar/Burma)
 - Eastern Mediterranean (Afghanistan, Iraq, Kuwait, Pakistan, Yemen, Sudan, Syria)

Additional information can be found at:

[cdc.gov/travel/yellowbook/2018/infectious-diseases-related-to-travel/hepatitis-b](https://www.cdc.gov/travel/yellowbook/2018/infectious-diseases-related-to-travel/hepatitis-b)

- US born persons not vaccinated as infants
- Persons with behavioral exposures to HBV (e.g., men who have sex with men, past or current injection drug users, history of incarceration)
- Persons receiving cytotoxic or immunosuppressive therapy
- Persons with liver disease or elevated ALT/AST of unknown etiology
- Pregnant women
- Household contacts and sex partners of HBV-infected persons
- Persons with HIV

If any of the following apply, do not screen for HBV:

- If the patient has a previously documented positive HBV test result, HBV testing does not need to be repeated. Obtain a copy of the results and

Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services Provided by Authorized Licensed Nurses, Fiscal Year 2022

document in the patient's medical record.

- If the patient has a documented negative HBV test result from a specimen collected within the last 14 days, HBV testing does not need to be repeated. Obtain a copy of the results and document in the patient's medical record.
3. For patients born during 1945 through 1965 (without prior ascertainment of hepatitis C virus (HCV) risk factors) or for patients with any of the following risk factors for HCV infection, **screen for HCV** using an FDA-cleared test for antibody to HCV (i.e., immunoassay, enzyme immunoassay (EIA) or enhanced chemiluminescence immunoassay (CIA) and, if recommended, a supplemental HCV test):
- Current or past injection drug use, including those who injected once or a few times many years ago
 - History of incarceration
 - Have certain medical conditions, including persons:
 - Who received clotting factor concentrates produced before 1987
 - Who were ever on long-term hemodialysis
 - With persistently abnormal ALT levels (if known/previously documented)
 - Who have HIV infection
 - Were prior recipients of transfusions or organ transplants, including persons who:
 - Were notified that they received blood from a donor who later tested positive for HCV infection
 - Received a transfusion of blood, blood components or an organ transplant before July 1992
 - Being born to a mother with HCV infection
 - Intranasal drug use
 - Receipt of an unregulated tattoo
 - Other percutaneous exposures

If any of the following apply, do not screen for HCV:

- If the patient has a previously documented positive HCV test result, HCV testing does not need to be repeated. Obtain a copy of the results and document in the patient's medical record.
- If the patient has a documented negative HCV test result from a specimen collected within the last 14 days, HCV testing does not need to be repeated. Obtain a copy of the results and document in the patient's medical record. Additional information can be found at:

[cdc.gov/travel/yellowbook/2018/infectious-diseases-related-to-travel-hepatitis-c](https://www.cdc.gov/travel/yellowbook/2018/infectious-diseases-related-to-travel-hepatitis-c)

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

4. Ask the patient about his or her vaccination history. Obtain documentation and confirm in ImmTrac. If the patient's vaccination status is not current, determine if the patient meets current DSHS or local Immunization Program eligibility criteria.
 - If so, immunization may be provided as authorized in the appropriate immunization SDO. Note the issue regarding administering live virus vaccines and the timing of TB screening tests in Attachment 3.
 - If not, refer patient to an appropriate immunization provider resource for vaccination.

C. Patients suspected or confirmed to have drug susceptible TB disease and who are prescribed treatment will have the following medical screening(s):

1. **Baseline and monthly clinical monitoring** and evaluation for TB medication toxicity:
 - If patient is taking **ethambutol**, this includes red/green color discrimination using Ishihara plates and visual acuity using Snellen chart.
 - If patient is taking **rifabutin**, this includes asking about eye pain, overall vision changes, and/or sensitivity to light.
 - If patient is taking **high dose isoniazid**, this is to include screening for peripheral neuropathy.
2. **Clinical evaluation as soon as feasible** when signs or symptoms of medication toxicity develop. In this case, hold the medications, contact the licensed healthcare provider, do not resume until re-started by the provider.

D. Patients receiving treatment for TB infection (including patients on window prophylaxis) will have the following medical screening(s):

1. **Baseline and monthly clinical monitoring** and evaluation for TB medication toxicity.
 - If patient is taking **rifabutin**, this includes asking about eye pain, overall vision changes, and/or sensitivity to light.
2. **Clinical evaluation as soon as feasible** when signs or symptoms of medication toxicity develop. In this case, hold the medications, contact the licensed healthcare provider, do not resume until re-started by the provider.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

ATTACHMENT 3: TB Screening Tests

A. The following patients may undergo TB screening testing:

1. All patients undergoing evaluation for, or diagnosed with, TB disease and there is not a documented previous positive tuberculin skin test (TST) or interferon-gamma release assay (IGRA) result performed in the United States or documented previous TB disease, *unless the criteria in #6 apply.*
2. All patients undergoing evaluation for TB infection and there is not a documented previous positive TST or IGRA result performed in the United States *unless the criteria in #6 apply.* Patients with history of severe reaction to a TST (i.e., blistering) should not have a repeat TST.
3. All contacts who meet criteria for testing, and there is not a documented previous positive TST or IGRA result or documented previous TB disease.
 - If the initial TB screening test is negative, administer a second TB screening test 8 to 10 weeks after the last exposure.
 - See **ATTACHMENT 7: Medications** for indications for window prophylaxis and recommendations to complete a full course of treatment for TB infection (beyond the window period) even if a TB screening test administered 8 weeks or more after the end of exposure is negative.
4. All patients who meet criteria for targeted testing, except screening in correctional facilities – monthly screening reports shall be submitted in accordance with TB and Hansen’s Disease Unit.
5. DSHS employees and contractors providing TB services, when TB screening is indicated.
6. Class B immigrants or other immigrants* (including refugees) undergoing immigration screening.

Exceptions: Immigrants who need evaluation for TB, including those who are reported from the Electronic Disease Notification (EDN) system with a classification of A or B, will have the following exceptions to repeat testing:

- a) Applicants with a documented positive IGRA test, even if performed overseas, do not need to have a repeat IGRA at the health department unless indicated by the licensed healthcare provider.
- b) For applicants under age 2 years old who have a TST performed overseas, the TST should not be repeated unless there is no specific documentation of a result (in mm induration), unless recommended by the licensed healthcare provider.
- c) For applicants over 2 years old, screen for TB with an IGRA if the last test done overseas was a positive TST only. Consideration of

Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services Provided by Authorized Licensed Nurses, Fiscal Year 2022

diagnosis should be made based on the IGRA result, however the licensed healthcare provider will need to consider items listed in B. 4., below.

**Applicants referred from a civil surgeon should not undergo a TB screening test initially at the health department; they should be referred to the health department only after a full evaluation has been done by the civil surgeon (that includes IGRA/TST and CXR).*

Refer to: [cdc.gov/immigrantrefugeehealth/exams/ti/civil/tuberculosis-civil-technical-instructions.html](https://www.cdc.gov/immigrantrefugeehealth/exams/ti/civil/tuberculosis-civil-technical-instructions.html).

B. TB screening tests may include TST OR IGRA:

1. It is important before applying a TB screening test that information is known about the patient's risk for infection and risk for progression to disease if infected. The single test that is most appropriate for the patient should be chosen and applied. More than one test should not be routinely performed.
2. Routine testing with BOTH a TST and an IGRA is not recommended. If an IGRA is chosen, it should be used in place of, NOT IN ADDITION TO, a TST.
3. Performing both a TST and an IGRA can be considered in the following situations after consulting with the licensed healthcare provider and receiving a patient-specific order for the additional test:
 - The initial test is negative and the risk for infection, the risk for progression, and the risk for a poor outcome are increased (e.g., when persons with HIV infection or children aged younger than five years are at increased risk for *Mycobacterium tuberculosis* (*M.tb*) infection), or
 - The initial test is negative and clinical suspicion exists for active tuberculosis disease (such as in persons with symptoms, signs, and/or radiographic evidence suggestive of active tuberculosis disease) and confirmation of *M.tb* infection is desired.
 - The initial test is positive and additional evidence of infection is required to encourage compliance or to confirm the positive test (e.g., in foreign-born health-care workers who believe their positive TST result is attributable to BCG). A positive IGRA might prompt greater acceptance of treatment for latent TB infection as compared with a positive TST alone.
 - The initial test is positive, and the patient is considered a healthy person who has a low risk for both infection and progression.
4. If both an IGRA and a TST are performed and discordant results are obtained, the licensed healthcare provider will need to make a determination regarding whether or not the patient should be considered to have TB infection, based

Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services Provided by Authorized Licensed Nurses, Fiscal Year 2022

on patient's risk factors, examination, and epidemiology (such as exposure risk). The TB and Hansen's Disease Unit can assist but cannot make this determination in lieu of the licensed healthcare provider.

5. If both an IGRA and a TST are performed because the initial test is negative, a positive result from a second test increases detection sensitivity. If the repeat test is positive and the patient is high risk, any positive test result should be considered evidence of TB infection and acted upon accordingly. If the second test is negative and the patient is high risk, it still does not conclusively rule out *M.tb* infection. Multiple negative results from any combination of these tests cannot exclude *M.tb* infection.
6. If both an IGRA and a TST are performed because the initial test is positive, a positive result from the second test increases the likelihood that the test result reflects infection.
 - An alternative is to assume, *without additional testing*, that the initial result is a false positive or that the risk for disease does not warrant additional evaluation or treatment, regardless of test results. This should only be considered after careful assessment of the patient's risk, physical exam findings and history of exposure.
 - Steps should be taken to minimize unnecessary and misleading testing of persons at low risk.
7. Repeating an IGRA or performing a TST should be considered when the initial IGRA result is indeterminate, borderline, invalid, or if interpretation results are in question and a reason for testing persists.
 - If an IGRA is to be repeated, a new blood sample should be used. In such situations, repeat testing with another blood sample usually provides interpretable results.
8. A TST is not recommended to be repeated unless the administration or reading of the TST is determined to be unreliable, the tuberculin PPD is determined to be expired, or if performed as 2nd round screening 8-10 weeks after a break in exposure.
9. When screening for TB with a TST or IGRA in persons who have been recently vaccinated, additional factors should be considered.
 - Live virus vaccines may impact TST or IGRA results due to temporary immune suppression, potentially causing false-negative reactions.
 - Live virus vaccines include: measles, mumps, rubella, varicella, zoster, yellow fever, intranasal influenza, oral polio and smallpox
 - The effects of the [COVID-19 mRNA vaccine](#), while not a live-virus vaccine, on TST or IGRA interpretations are unknown.
 - When possible, placing a TST or drawing an IGRA should occur prior to

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- vaccinations.
- When that is not possible, a TST or IGRA should not be delayed in persons with risk factors for TB. Providers may order a repeat screening test 4 weeks after vaccination if the initial test is negative.
 - Contact the licensed healthcare provider before making decisions to delay a TST or IGRA for at-risk persons.
 - Vaccinations should not be delayed to accommodate TB screening procedures, as a repeat screening may be arranged as needed.

C. Which TB screening test to choose:

1. Before a TB screening test is performed, the advantages and limitations of TST and IGRA must be evaluated for each patient. Refer to **Figure 1** for choosing the appropriate TB test in children.
 - Per the American Academy of Pediatrics Redbook, 2021, 32nd Edition: *"The published experience testing children with IGRAs demonstrates that IGRAs consistently perform well in children 2 years and older, and some data support their use for even younger children."*
 - IGRAs may be considered in children ≥ 1 year old, especially if BCG vaccinated. Contact the licensed healthcare provider.
2. An IGRA is *preferred* for testing the following groups or individuals aged **two (2) years and older:**
 - High-risk individuals who have previously received BCG
 - Congregate settings, for employees and residents
 - Persons with diabetes or on dialysis
 - Immunocompromised persons
 - Persons undergoing contact investigation
 - Persons who work with TB patients
 - Persons anticipated to receive TNF- α inhibitors or other biologic response modifiers
 - a. If an IGRA is used, there is no preference for the use of one IGRA over another.
 - b. When IGRA testing is performed greater than 3 days after TST, the PPD injection should be expected to boost anamnestic immune responses measured by IGRA originating from *M.tb* infection (but not from BCG vaccination or in non-sensitized persons). The effect also appears to be more apparent in those individuals who are already IGRA positive. To date, there is no definitive data and some experts suggest waiting 3 months after TST before testing with IGRA, while others feel this is unnecessary.
Decisions to delay IGRA testing can only be made by the licensed healthcare provider.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

3. **TST is preferred for testing patients younger than 2 years old** and may be used if the patient is unable to receive an IGRA or refuses phlebotomy. For infants younger than 6 months, a negative TST cannot be confirmed until the infant is 6 months old, or after the break in contact period, whichever is later. If the test is positive, then refer for medical evaluation. If negative, then retest at age 6 months or 8-10 weeks after the break in contact, whichever is later, to confirm a negative test.

Any infant who is a contact to infectious tuberculosis should be placed on window prophylaxis until the TST can be confirmed. See **Attachment 7: Medications**.

- a. Do NOT administer TST if any of the following apply*. Contact the licensed healthcare provider for instructions.
- Allergy to any component of TUBERSOL or APLISOL or an anaphylactic or other allergic reaction/hypersensitivity to a previous test of tuberculin purified protein derivative (PPD)
 - Severe reaction to previous TST such as ulceration, necrosis, blistering, bullae, anaphylaxis
 - A documented history of treatment for TB infection or disease
 - Extensive burns or eczema

4. *From:*

[fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts / ucm114924.pdf](https://www.fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts/ucm114924.pdf) and
[fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts / ucm114912.pdf](https://www.fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts/ucm114912.pdf)

If TST is performed, provide instructions to the patient regarding care of the injection site, then read and interpret the TST result within 48 to 72 hours.

- b. Definition of TST Reaction:

- **Negative reaction:** An induration less than the specified criteria based on risk factors shows either a lack of tuberculin sensitivity or a low grade sensitivity that most likely is not caused by *Mycobacterium tuberculosis* complex (*M.tb*). A negative test does not rule out the presence of TB.
- **Positive Reaction:** An induration greater than or equal to the specified criteria based on risk factors indicates infection with *M.tb*.

- c. TST Interpretation:

- 1) An induration of **5 mm or more** is considered to be positive for:
- HIV-infected persons

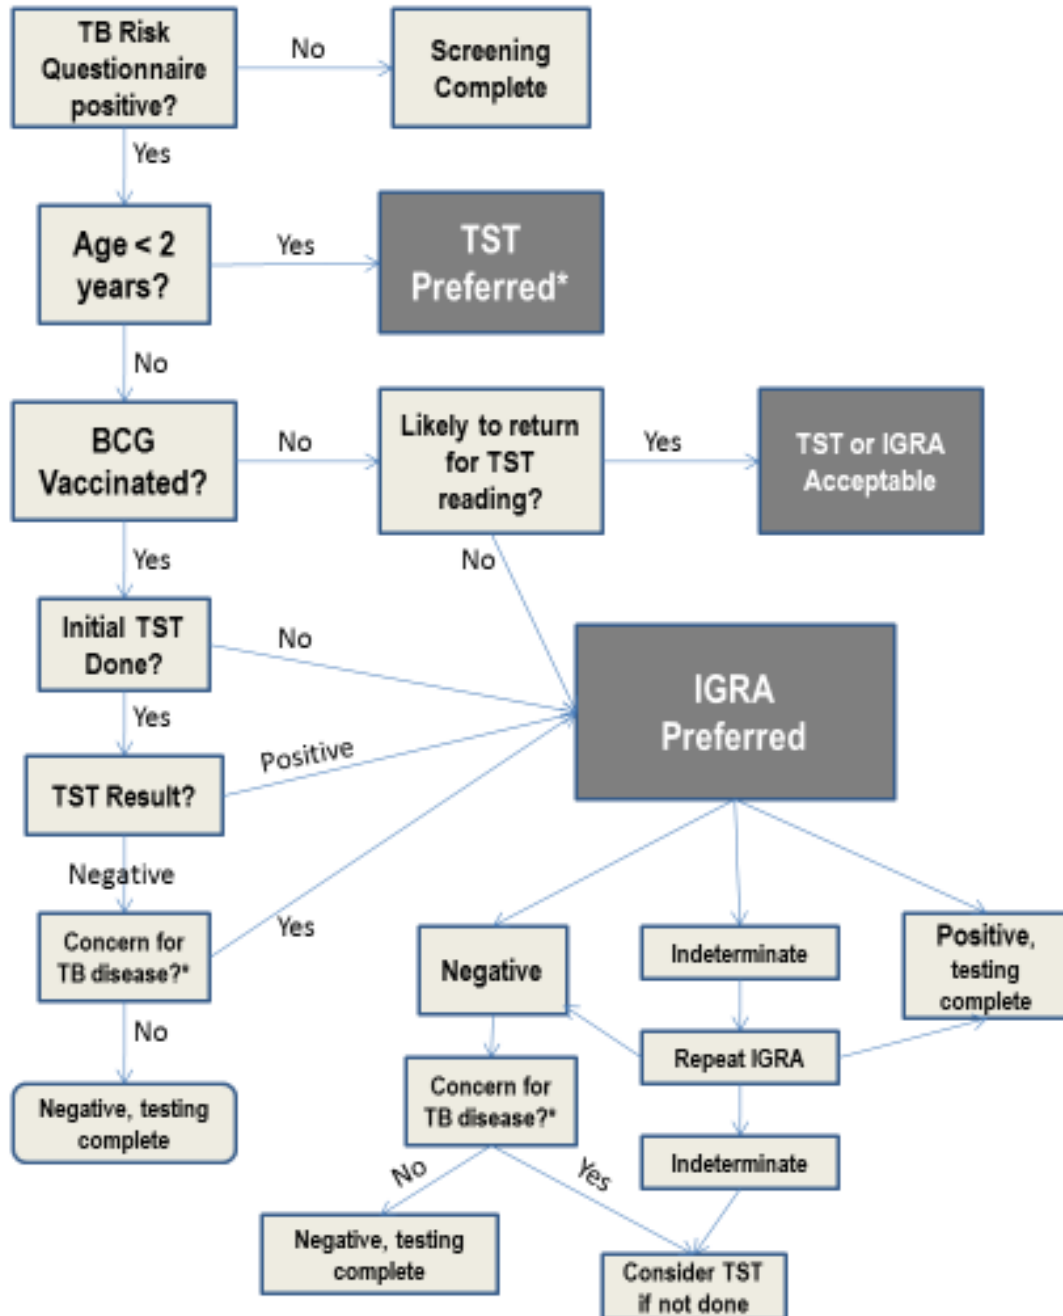

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- Recent contacts to a known TB case
 - Individuals with fibrotic changes on chest radiograph consistent with old TB
 - Persons with organ transplants and other immunosuppressed persons (such as taking the equivalent of greater than 15 mg/day prednisone for longer than 1 month or taking tumor necrosis factor- α antagonists)
- 2) An induration of **10 mm or more** is considered to be positive for:
- Individuals from high-prevalence countries
 - Injection drug users
 - Residents and employees of high-risk congregate settings: correctional facilities, nursing homes and other healthcare or long-term care facilities, residential facilities for AIDS patients, and homeless shelters
 - Mycobacteriology laboratory personnel
 - Persons with high-risk clinical conditions: silicosis, diabetes mellitus, chronic renal failure, some hematologic disorders (e.g., leukemias and lymphomas), other specific malignancies (e.g., carcinoma of the head or neck and lung), weight loss of > 10% of ideal body weight, gastrectomy, jejunioileal bypass
 - Children younger than 5 years of age.
 - Infants, children, adolescents exposed to adults in high-risk categories
- 3) An induration of **15 mm or more** is considered to be positive for:
- Individuals with no known risk factors for tuberculosis.

Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services Provided by Authorized Licensed Nurses, Fiscal Year 2022

Figure 1: *Algorithm for TB Testing in Children*

Algorithm for TB Testing in Children

*Either positive TST or IGRA considered significant (indicative of TB infection or disease) if there is clinical suspicion of disease or high risk for progression or poor outcome in patients with latent TB infection
 Geltemeyer A, Smith KC. 16th Annual Conference of the IUATLD-North American Region, Feb 2012.

Algorithm courtesy of Heartland National Tuberculosis Center

Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

ATTACHMENT 4: Laboratory Tests (Labs)

A. Patients suspected or confirmed to have TB disease age 18 or older, will have the following labs collected under the following circumstances:

At Baseline:

1. Measurements of complete blood count (CBC).
2. Liver function tests to include at least: AST, ALT, total bilirubin, alk phos, albumin, and creatinine.

Monthly:

1. Measurements of CBC if the baseline result is abnormal.
2. Measurements of AST, ALT, total bilirubin, and alk phos for patients whose baseline results are abnormal, and/or those with risk factors for hepatotoxicity or other complications, including but not limited to:
 - Pregnant patients
 - Female patients during the first three months postpartum
 - Patients with or at risk for HBV, HCV, or other liver disorder
 - Patients taking medications for other comorbidities or chronic medical conditions that may affect the liver or kidneys
 - Patients who use alcohol or recreational drugs (orally or by injection)
 - Patients with HIV infection/AIDS
 - Patients on medications that affect or are excreted by the liver

As Needed:

1. Measurement of AST, ALT and total bilirubin if:
 - AST, ALT level exceeds **more than three times** the upper limit of normal **in the presence of symptoms** or
 - AST, ALT level exceeds more than **five times the upper limit** of normal **with or without symptoms** present, or
 - Bilirubin exceeds **two times the upper limit** of normal.Hold medication and contact the licensed healthcare provider for instructions.
2. Measurements of a CMP and CBC if signs or symptoms are compatible with hepatotoxicity, including nausea or vomiting. Hold medication and contact the licensed healthcare provider.
3. Therapeutic drug monitoring for patients who are slow to respond to therapy and/or who have risk factors for poor drug absorption as determined by the licensed healthcare provider. Refer to *Therapeutic Drug Monitoring Process* at:

Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services Provided by Authorized Licensed Nurses, Fiscal Year 2022

dshs.texas.gov/disease/tb/forms/#resources.

Note: **Routine testing of serum uric acid is not recommended.** Acute gouty arthritis is a known adverse effect of pyrazinamide (PZA) and is rare except in patients with preexisting gout, which is generally a contraindication to the use of the drug. Non-gouty polyarthralgia may occur in up to 40% of patients receiving daily doses of PZA and rarely requires dosage adjustment or discontinuation of the drug. Asymptomatic hyperuricemia is an expected effect of the drug and is generally without adverse consequence. See [cdc.gov/mmwr/preview/mmwrhtml/rr5211a1.htm](https://www.cdc.gov/mmwr/preview/mmwrhtml/rr5211a1.htm) for additional information. If the patient develops signs and symptoms consistent with acute gouty arthritis, hold medication and contact the licensed healthcare provider for instructions.

B. Patients receiving treatment for TB infection (including patients on window prophylaxis) age 18 or older will have the following labs collected under the following circumstances:

At Baseline:

1. Measurements of AST, ALT, total bilirubin, alk phos, and albumin for all patients starting treatment for TB infection **AND** who have risk factors for potential hepatotoxicity or other complications, including but not limited to:
 - Pregnant patients
 - Female patients during the first 3 months postpartum
 - Patients with or at risk for HBV, HCV, or other liver disorders
 - Patients with other comorbidities or chronic medical conditions
 - Patients who use alcohol or recreational drugs (orally or by injection)
 - Patients with HIV infection/AIDS
 - Patients on medications that affect or are excreted by the liver
2. Measurement of a complete blood count (CBC) if starting on a rifamycin.

Monthly:

1. Measurements of AST, ALT, total bilirubin, and/or alk phos if the baseline result is abnormal.
2. CBC if patient will be taking a regimen that includes a rifamycin, if the baseline CBC is abnormal.
3. Measurements of AST, ALT, total bilirubin, and alk phos for patients with risk factors for hepatotoxicity or other complications, including but not limited to:
 - Pregnant patients

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- Female patients during the first three months postpartum
- Patients with or at risk for HBV, HCV, or other liver disorder
- Patients with other comorbidities or chronic medical conditions
- Patients who use alcohol or recreational drugs (orally or by injection)
- Patients with HIV infection/AIDS
- Patients on medications that affect or are excreted by the liver

As Needed:

1. Measurement of AST, ALT and total bilirubin if:
 - AST, ALT level exceeds **more than three times** the upper limit of normal **in the presence of symptoms** or
 - AST, ALT level exceeds more than **five times the upper limit** of normal **with or without symptoms** present, or
 - Bilirubin exceeds **two times the upper limit** of normal.Hold medication and contact the licensed healthcare provider for instructions.

2. Measurement of CMP and CBC if signs or symptoms are compatible with hepatotoxicity, including nausea or vomiting. Hold medication and contact the licensed healthcare provider.

NOTE: **For patients younger than 18 years**, considerations can be made for laboratory testing of children who meet the following criteria: chronic medical conditions, those on medications chronically, those with increased body mass index (BMI), pregnancy, disseminated disease or who endorse substance use. Contact the licensed healthcare provider. Note: alk phos varies in children depending on growth cycles, ensure that consideration is made for interpreting pediatric laboratory values.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

ATTACHMENT 5: Chest X-Ray (CXR)

For patients younger than 18 years old, or patients with HIV infection, CXR should include posterior-anterior and lateral views.

For adult patients, CXR should include at least posterior-anterior view.

For pregnant patients evaluated for active TB disease, CXR should be done without delay and with appropriate shielding, even in the first trimester, if indicated.

A. The following patients will have an initial CXR:

1. Patients suspected or confirmed to have TB disease:

- a. All patients exhibiting signs and symptoms of active pulmonary TB disease.
- b. Patients with suspected or known extra-pulmonary TB to assess for the presence of pulmonary involvement.

2. Patients with TB infection:

- a. Patients exhibiting signs and symptoms of active pulmonary TB disease.
- b. Patients newly identified as infected with TB based upon a documented positive TST result or documented positive IGRA result.

3. Patients undergoing evaluation as part of a contact investigation:

- a. Patients exhibiting signs and symptoms of active pulmonary TB disease.
- b. Patients newly identified as infected with TB based upon a documented positive TST result or documented positive IGRA result.
- c. Patients who are contacts to a TB case and have documentation of a prior positive TB screening test but have not been treated for TB infection.
- d. Patients* who are contacts to a TB case and who are at high risk of progression to active TB disease **regardless of their TB screening test result and regardless of prior treatment for TB infection or TB disease:**
 - Children younger than 5 years old
 - Patients who have HIV infection or at high risk for HIV infection
 - Patients who have an immunocompromising condition, such as patients on dialysis
 - Patients receiving immunosuppressive therapy
- e. Patients who have a previous CXR showing pulmonary fibrotic lesions (presumed from prior TB) and have not been treated for TB.

**These patients may be recommended for re-treatment. Contact the licensed healthcare provider.*

4. Patients who have been referred to the health department for evaluation through the Electronic Disease Notification (EDN) system

Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services Provided by Authorized Licensed Nurses, Fiscal Year 2022

or who have self-referred for services, when indicated. EDN patients needing an *initial* CXR include:

- Any patient with signs and symptoms of TB disease
- Any patient with a positive IGRA or TST on **domestic** screening
- All patients with known HIV infection
- Any patient classified as a Class A or B* whose overseas medical examinations are unavailable and/or there has been a change in clinical status (i.e., new signs or symptoms of pulmonary or extrapulmonary TB disease)
- Any EDN patient *as determined by the licensed health care provider*

**Some providers may recommend repeating radiology domestically for any patient with Class A or B TB classification if the CXR was performed overseas; contact the licensed healthcare provider.*

For full guidelines on screening immigrants referred from the Electronic Disease Notification (EDN), see:

[cdc.gov/immigrantrefugeehealth/guidelines/domestic/tuberculosis-guidelines.html](https://www.cdc.gov/immigrantrefugeehealth/guidelines/domestic/tuberculosis-guidelines.html)

B. The following patients will have a follow-up CXR:

1. Patients suspected or confirmed to have TB disease:

- a. For all patients who started medication for TB, regardless of culture results, a CXR at completion of 2 months of treatment.
- b. All patients should have a CXR near or at the end of treatment to serve as a new baseline for future evaluations, unless a previous CXR is negative.

If any of the following apply, do not obtain a follow-up CXR:

- If a previous CXR (baseline or at 2 months) is negative, an end of treatment CXR is not necessary.
- Follow-up CXRs are not necessary for patients with extrapulmonary TB disease, if initial sputum collection results are negative and initial CXR is normal.

2. Patients with TB infection (including patients on window prophylaxis):

- a. Patients who report or begin to exhibit symptoms suggestive of TB disease should have a follow-up CXR before continuing on treatment for TB infection.
- b. Patients who have *not started treatment* for TB infection *within one month* of the initial CXR showing no abnormalities suggestive of TB disease AND

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

are at high risk of progression to active TB disease must have a repeat CXR showing no abnormalities suggestive of TB disease prior to the initiation of therapy.

The following patients are at **high risk of progression to** active TB disease:

- Children younger than 5 years of age
 - Patients who have HIV infection or at high risk for HIV infection
 - Patients who have an immunocompromising condition or other clinical condition that is associated with progression to active TB (such as substance abuse, silicosis, underweight by more than 5%, diabetes, chronic renal failure, gastrectomy, jejunioileal bypass, solid organ transplantation, head and neck cancer)
 - Patients receiving immunosuppressive therapy
 - Patients with a documented change in TB screening test results from a negative to positive and other patients who have been recently infected with TB (such as close contacts of a person with infectious TB disease, patients who have immigrated from areas of the world with high rates of TB, patients within groups having high rates of TB transmission [homelessness, injection drug users] or within groups who work or reside with people who are at high risk for TB in facilities or institutions [hospitals, homeless shelters, correctional facilities, nursing homes, residential homes for those with HIV])
 - Patients with pulmonary fibrotic lesions seen on CXR (presumed to be from prior, untreated TB)
- c. Patients who have an *interruption* in TB infection treatment *longer than one month during the first 2 months of treatment* AND are at high risk of progression to active TB disease (see list above) must have a repeat CXR showing no abnormalities suggestive of TB disease prior to the re-initiation of therapy. Otherwise, reimaging is not necessary unless the patient has symptoms consistent with active TB disease.
- d. All other patients who are not at high risk of progressing to active TB disease who have *not started treatment for TB infection **within 6 months*** of the initial CXR showing no abnormalities suggestive of TB disease must have a repeat CXR showing no abnormalities suggestive of TB disease prior to the initiation of therapy.
- e. All other patients who are not at high risk of progressing to active TB disease who have an *interruption* in TB infection treatment **and treatment needs to be re-started must have a repeat CXR** showing no abnormalities suggestive of TB before therapy is re-started.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

ATTACHMENT 6: Sputum Collection

When possible, all sputum specimens should be mailed to the laboratory on cold packs in order to preserve the specimen as long as possible. Refer to *Tuberculosis Specimen Shipping Guide* at:

dshs.texas.gov/disease/tb/policies/TBSpecimenShippingGuide.pdf

A. Patients suspected or confirmed to have PULMONARY TB disease:

1. For all patients, collect 3 consecutive sputum specimens - ideally 24 hours apart, but at minimum 8 hours apart with at least one specimen collection observed and one collection in early morning. Sputum collection must occur within 7 days before (preferable) to 7 days after medication start date.
 - a. Submit 3 sputum specimens for acid-fast bacilli (AFB) smear and culture. The DSHS Laboratory will perform drug susceptibility testing (DST) reflexively on the initial *M.tb* culture positive specimen. The DSHS Laboratory will repeat the DST if the patient is still *M.tb* culture-positive 3 months or more after the initial specimen collection date, or upon physician request.
 - b. For all patients who have no laboratory confirmation of a rapid test that shows rifampin resistance (i.e., GeneXpert), regardless of positive *M. tb* cultures, request nucleic acid amplification testing (NAA) on one of the first 3 diagnostic sputum specimens and label the initial specimens "1 of 3," "2 of 3," and "3 of 3" **unless drug susceptibility test (DST) results are known**. The lab will perform NAA on only the most suitable specimen. For interpretation and response to NAA test results, refer to **Figure 2**, below.
 - c. For patients who have an *initial AFB sputum smear positive* result and the **NAA is negative**, the DSHS laboratory will reflexively perform a second NAA on a second AFB smear positive specimen, if it is available. *Repeat NAAs will only be performed if that second specimen is AFB smear positive. If a second AFB sputum smear positive specimen is not available, contact the licensed healthcare provider if a repeat NAA order is needed to develop a treatment plan.*
2. For patients who have positive initial AFB smears at the time of diagnosis, collect 3 sputum specimens, with at least one specimen collection in early morning, for AFB smear every 2 weeks until 3 consecutive specimens are negative on AFB smear.
3. For all patients, collect up to 3 sputum specimens, with at least one specimen collection in early morning, for AFB smear and culture at least once a month

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

until 2 consecutive specimens (at least one month apart) are negative on culture and there are no further positive cultures. *At this point, the patient has reached culture conversion.*

4. For patients who have completed < 80% of planned doses in the continuation phase of TB treatment and have an interruption of therapy, collect 3 sputum specimens, with at least one specimen collection in early morning, for AFB smear and culture.
5. For patients with MDR-TB, after culture conversion, continue to collect at least one sputum specimen for AFB smear and culture, with at least one specimen collection in early morning, at least once a month, until treatment completion.
6. For all patients, if possible, collect one final sputum specimen in early morning for AFB culture at completion of therapy.

B. Patients confirmed to have EXTRAPULMONARY TB disease:

1. For patients with suspected or known extrapulmonary TB, attempts should be made to collect 3 sputum specimens - ideally 24 hours apart, but at minimum 8 hours apart, with at least one specimen collection observed and one collection in early morning, even if the CXR is normal, in order to exclude concomitant pulmonary disease.
 - a. Submit 3 sputum specimens for AFB smear and culture. The DSHS Laboratory will perform DST reflexively on the initial *M.tb* culture-positive specimen. The DSHS Laboratory will repeat the DST if the patient is still *M.tb* culture positive 3 months or more after the initial specimen collection date, or upon physician request.
 - b. Submit all diagnostic sputum specimens on cold pack. For all patients who have no laboratory confirmation of a rapid test that shows rifampin resistance (i.e. GeneXpert), regardless of positive *M. tb* cultures, request nucleic acid amplification testing (NAA) on one of the first 3 diagnostic sputum specimens and label the initial specimens "1 of 3," "2 of 3," and "3 of 3" **unless DST results are already known**. The lab will perform NAA on only the most suitable specimen.
2. For patients whose initial sputum results are positive, collect follow-up sputum as described in section A. *Patients suspected or confirmed to have PULMONARY TB disease.*
3. If Gastrointestinal (GI) or genitourinary (GU) TB is suspected, stool or urine samples can be collected in addition to sputum (as above) and sent for NAA

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

test, AFB smear and culture. Contact DSHS State Lab for submission criteria **prior** to shipping dshs.texas.gov/lab/myco_home.shtm

C. Patients with TB infection (including patients on window prophylaxis):

1. For patients who develop signs and symptoms suggestive of TB disease, collect 3 consecutive sputum specimens - ideally 24 hours apart, but at minimum 8 hours apart, with at least one specimen collection observed and one collection in early morning.
 - a. Submit 3 sputum specimens for AFB smear and culture. The DSHS Laboratory will perform DST reflexively on the initial *M.tb* culture-positive specimen. The DSHS Laboratory will repeat the DST if the patient is still *M.tb* culture positive 3 months or more after the initial specimen collection date, or upon physician request.
 - b. Submit all diagnostic sputum specimens on cold pack. For all patients who have no laboratory confirmation of a rapid test that shows rifampin resistance (i.e. GeneXpert), regardless of positive *M. tb* cultures, request nucleic acid amplification testing (NAA) on one of the first 3 diagnostic sputum specimens and label the initial specimens "1 of 3," "2 of 3," and "3 of 3" **unless DST results are already known**. The lab will perform NAA on only the most suitable specimen.
2. For patients with CXR findings suggestive of prior, healed TB disease, collect 3 consecutive sputum specimens - ideally 24 hours apart, but at minimum 8 hours apart, ideally with no more than 96 hours between the first and the third sputum specimen collection - with at least one specimen collection observed and one collection in early morning.
 - a. Submit 3 sputum specimens for AFB smear and culture. The DSHS Laboratory will perform DST reflexively on the initial *M.tb* culture-positive specimen. The DSHS Laboratory will repeat the DST if the patient is still *M.tb* culture positive 3 months or more after the initial specimen collection date, or upon physician request.
 - b. Submit all diagnostic sputum specimens on cold pack. For all patients who have no laboratory confirmation of a rapid test that shows rifampin resistance (i.e. GeneXpert), regardless of positive *M. tb* cultures, request nucleic acid amplification testing (NAA) on one of the first 3 diagnostic sputum specimens and label the initial specimens "1 of 3," "2 of 3," and "3 of 3" **unless DST results are already known**. The lab will perform NAA on only the most suitable specimen.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

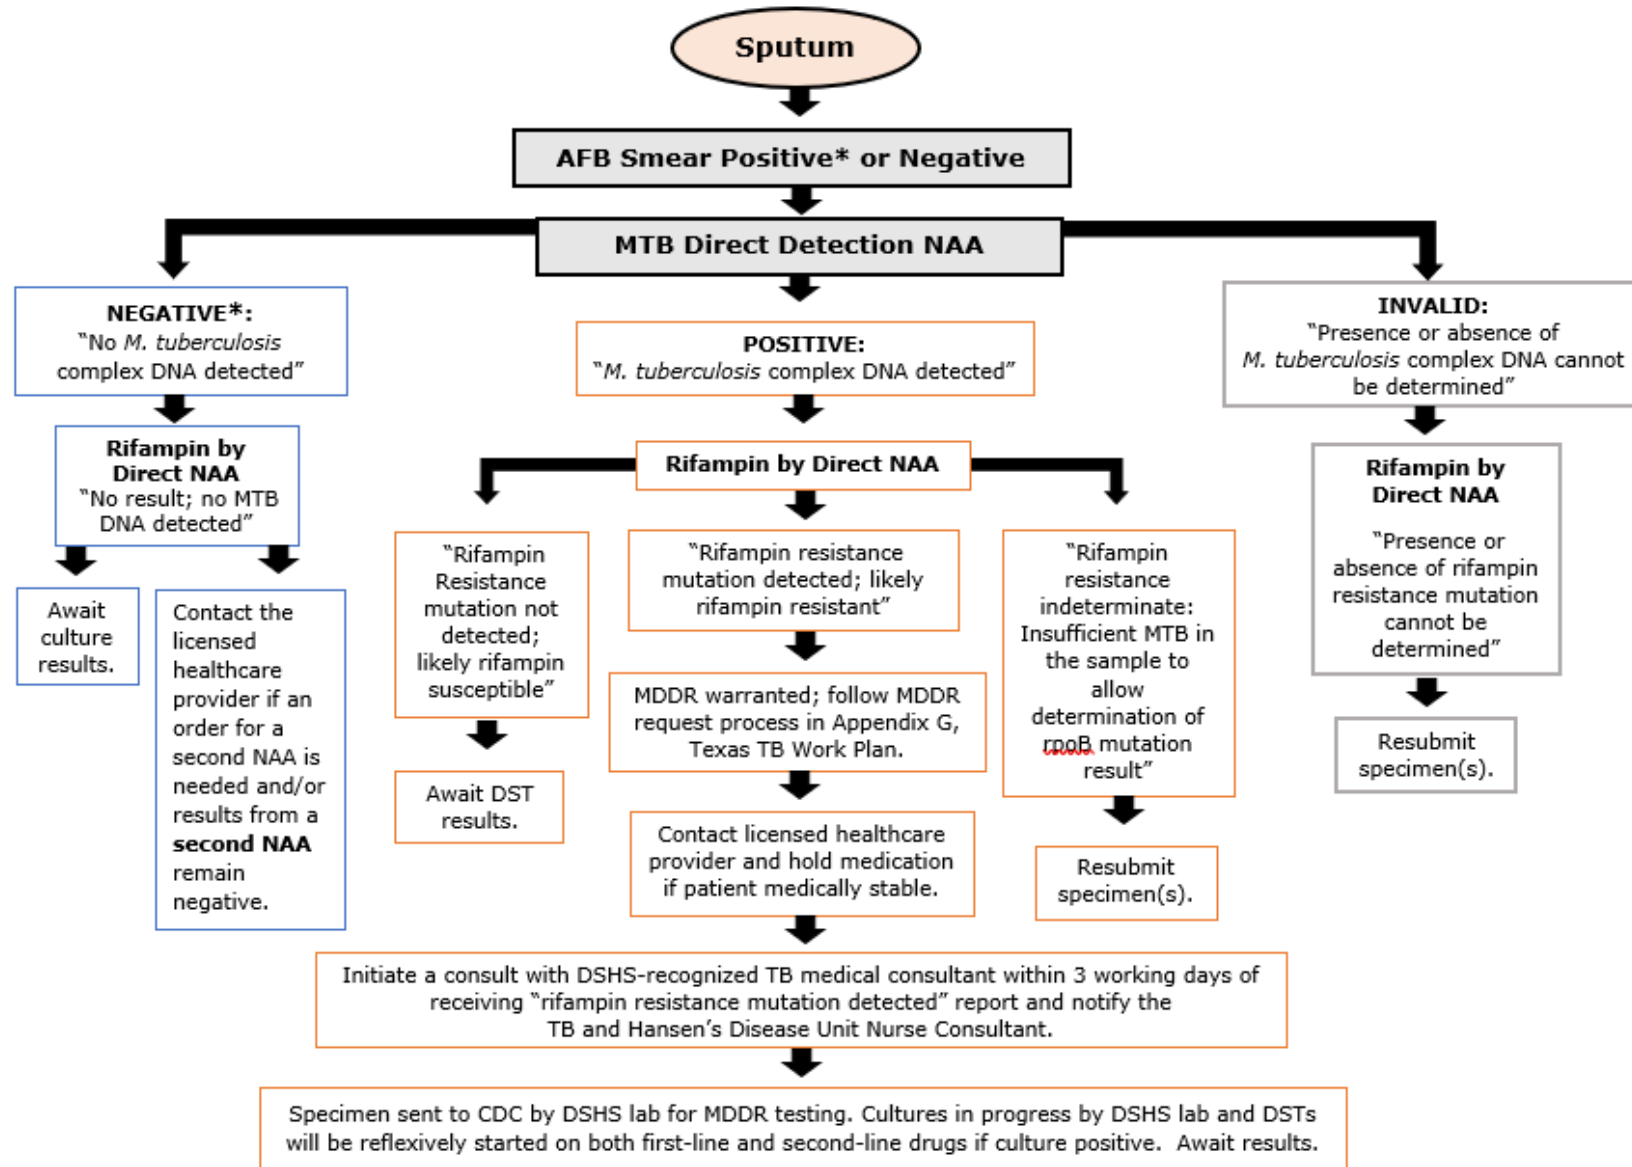

- c. Results of all AFB smears and cultures must be negative before treatment for TB infection is started.
3. For patients with HIV infection and respiratory symptoms, even if the CXR is normal.

Prior to the initiation of therapy, collect 3 consecutive sputum specimens - ideally 24 hours apart, but at minimum 8 hours apart, with no more than 96 hours between the first and the third sputum specimen collection - with at least one specimen collection observed and one collection in early morning.

- a. Submit 3 sputum specimens for AFB smear and culture. The DSHS Laboratory will perform DST reflexively on the initial *M. tb* culture-positive specimen. The DSHS Laboratory will repeat the DST if the patient is still *M. tb* culture positive 3 months or more after the initial specimen collection date, or upon physician request.
- b. Submit all diagnostic sputum specimens on cold pack. For all patients who have no laboratory confirmation of a rapid test that shows rifampin resistance (i.e. GeneXpert), regardless of positive *M. tb* cultures, request nucleic acid amplification testing (NAA) on one of the first 3 diagnostic sputum specimens and label the initial specimens "1 of 3," "2 of 3," and "3 of 3" **unless DST results are already known**. The lab will perform NAA on only the most suitable specimen.
- c. Results of all AFB smears and cultures must be negative and respiratory symptoms must be explained by another etiology before treatment for TB infection is started.

Provided by Authorized Licensed Nurses, Fiscal Year 2022**

ATTACHMENT 7: Medications

A. Patients suspected or confirmed to have TB disease:

Administer the following medications after verifying that a current order is written by the licensed healthcare provider; that order should be implemented within **3** business days, or a new order must be received. Tables 1-3 are for reference only and do not replace medication orders from the licensed healthcare provider.

TABLE 1. Drug Regimens for Culture-Positive Pulmonary TB caused by Drug-Susceptible Organisms

Regimen	Intensive Phase		Continuation Phase			Range of total doses, (duration)	Comments
	Drugs	Interval, Dose	Regimen	Drugs	Interval and Dose, Duration		
1	INH, RIF, PZA, EMB*	7 days/wk for 56 doses in 8 wks, or 5 days/wk for 40 doses in 8 weeks	1a	INH, RIF	If 6 months' total therapy: 7 days/wk for 126 doses in 18 wks or 5 days/wk for 90 doses in 18 wks	182-130 (26 weeks)	Preferred regimen for patients with newly diagnosed tuberculosis.
			1b		If 9 months' total therapy: 7 days/wk for 217 doses in 31 wks or 5 days/wk for 155 doses in 31 wks	273-195 (39 weeks)	
2	INH, RIF, PZA, EMB*	7 days/wk for 56 doses in 8 wks, or 5 days/wk for 40 doses in 8 weeks	2a	INH, RIF	If 6 months' total therapy: 3 times/wk** for 54 doses in 18 wks	110-94 (26 weeks)	May be used as an alternative regimen when daily DOT in the continuation phase is not possible.
			2b		If 9 months' total therapy: 3 times/wk** for 93 doses in 31 wks	149-133 (39 weeks)	
3**	INH, RIF, PZA, EMB*	3 times weekly for 24 doses in 8 weeks	3a	INH, RIF	If 6 months' total therapy: 3 times/wk for 54 doses in 18 wks	78 (26 weeks)	Not preferred, consult recommended before use. Use with caution in patients with HIV and/or cavitory or extensive disease.
			3b		If 9 months' total therapy: 3 times/wk for 93 doses in 31 wks	117 (39 weeks)	

**Texas Department of State Health Services Standing Delegation Orders for Tuberculosis Clinical Services
Provided by Authorized Licensed Nurses, Fiscal Year 2022**

Table 1. Continued

Definition of abbreviations: **INH** = Isoniazid; **RIF** = Rifampin; **PZA** = Pyrazinamide; **EMB** = Ethambutol

NOTE: Daily dosing is the preferred standard of care for all patients. Interventions to support daily dosing, including video DOT (VDOT), should be arranged when possible, as intermittent dosing is less efficacious and leads to higher rates of relapse. Table 1 reflects regimens listed in order of preference. Consultation is required for dosing less than three times per week.

***EMB:** may be stopped if the isolate is susceptible to RIF and INH.

**Intermittent therapy may be considered in individuals with low risk of relapse (i.e. drug-susceptible TB organisms, that at the start of treatment is non-cavitary and/or smear negative, and those who are HIV negative.) Consultation with a DSHS-Recognized TB Medical Consultant is recommended.

Table originally adapted from Treatment of Tuberculosis. MMWR. 2003; 52(RR11) and includes updated guidelines from Official American Thoracic Society/Centers for Disease Control and Prevention/Infectious Diseases Society of America Clinical Practice Guidelines: Treatment of Drug-Susceptible Tuberculosis. Clinical Infectious Diseases (2016) 63 (7): e147-e195. [cdc.gov/tb/publications/guidelines/pdf/clin-infect-dis.-2016-nahid-cid_ciw376.pdf](https://www.cdc.gov/tb/publications/guidelines/pdf/clin-infect-dis.-2016-nahid-cid_ciw376.pdf)

TABLE 2. Doses of First-Line Anti-Tuberculosis Drugs for ADULTS

Daily Dosing				
Weight (kg) <i>Based on estimated lean body weight</i>	Isoniazid* (INH) Dose, mg (mg/kg)	Rifampin** (RIF) Dose, mg (mg/kg)	Pyrazinamide (PZA) Dose, mg (mg/kg)	Ethambutol (EMB) Dose, mg (mg/kg)
40-55 kg	300† mg (5mg/kg)	600 mg (10-20mg/kg‡)	1,000 mg (18.2–25.0)	800 mg (14.5–20.0)
56-75 kg			1,500 mg (20.0–26.8)	1,200 mg (16.0–21.4)
76-90 kg			2,000† mg (22.2–26.3)	1,600† mg (17.8–21.1)
Thrice (3x) Weekly Dosing				
Weight (kg) <i>Based on estimated lean body weight</i>	Isoniazid* (INH) Dose, mg (mg/kg)	Rifampin** (RIF) Dose, mg (mg/kg)	Pyrazinamide (PZA) Dose, mg (mg/kg)	Ethambutol (EMB) Dose, mg (mg/kg)
40-55 kg	900† mg (15mg/kg)	600 mg (10-20mg/kg)	1,500 mg (27.3–37.5)	1,200 mg (21.8–30.0)
56-75 kg			2,500 mg (33.3–44.6)	2,000 mg (26.7–35.7)
76-90 kg			3,000† mg (33.3–39.5)	2,400† mg (26.7–31.6)
Forms available	Scored tablets: 100 mg, 300 mg and Syrup (50mg/5ml)	Capsule: 150 mg, 300 mg <i>(compounding available for select patients–Contact DSHS Pharmacy)</i>	Scored tablets: 500 mg	Tablets: 100 mg, 400 mg
<p>*Isoniazid: Supplementation with pyridoxine (vitamin B6) 25-50 mg daily is recommended in the following: pregnant women, infants receiving INH and breastfeeding, patients with diets likely deficient in pyridoxine, patients with paresthesia, patients age ≥65 years or patients who have a risk factor for paresthesia (e.g., HIV/AIDS, alcohol use, diabetes).</p> <p>**Rifampin: Drug interactions with potentially serious consequences may occur when using Rifampin. Of particular concern are reductions, often to ineffective levels, in serum concentrations of common drugs, such as oral contraceptives, methadone, and warfarin. There are important bidirectional interactions between rifamycins and antiretroviral agents. Because information regarding rifamycin drug interactions is evolving rapidly, consult a trusted drug information resource to obtain the most up-to-date information.</p> <p>‡Rifampin Dosing: Many experts recommend using a daily rifampin dose of 20-30mg/kg/day for adults and children with serious forms of TB such as meningitis and disseminated disease. See American Academy of Pediatrics Red Book, 2021, 32nd Edition. Consultation recommended.</p> <p>†Maximum dose regardless of weight, unless otherwise recommended by a DSHS Recognized TB Medical Consultant.</p>				

Table adapted from Treatment of Drug-Susceptible Tuberculosis 2016 ATS/CDC/PIDS America Clinical Practice Guidelines: https://www.cdc.gov/tb/publications/guidelines/pdf/Clin-Infect-Dis.-2016-Nahid-cid_ciw376.pdf PZA, EMB dose ranges from Heartland National TB Center and The Spectrum of Tuberculosis from Infection to Disease, TB at a Glance, 3rd Edition: heartlandntbc.org/assets/products/The_Spectrum_of_TB.pdf

Provided by Authorized Licensed Nurses, Fiscal Year 2022**

TABLE 3. PEDIATRIC (age 17 and younger) Dosing Range for Daily, Maximum Doses, and Forms Available for First-Line Anti-Tuberculosis Drugs

Daily Dose Range*					
Child's Weight (kg)	Isoniazid (INH) 10-15 mg/kg Dose, mg Max dose: 300mg	Pyrazinamide (PZA) 30-40 mg/kg Dose, mg Max dose: 2000mg	Ethambutol (EMB) 15-25 mg/kg Dose, mg Max dose: 1000mg	Rifampin (RIF) ≥2 years 15-20 mg/kg Dose‡, mg Max dose: 600mg	Rifampin (RIF) <2 years 20-30 mg/kg Dose‡, mg Max dose: 600mg
3-5	50 mg	125 mg	50-100 mg	50-75 mg	75-100 mg
6-9	100 mg	250 mg	150 mg	100-150 mg	150-200 mg
10-15	150 mg	375-500 mg	250 mg	150-300 mg	200-300 mg
16-20	200 mg	500-750 mg	300 mg	300 mg	450 mg
21-25	300 mg	750 mg	400 mg	300-450 mg	450-600 mg
26-30	300 mg	1000	600-700 mg	450-600 mg	600 mg
31-45	300 mg	1250-1500	800 mg	600 mg	600 mg
46-50	300 mg	1500-2000 mg	1000 mg	600 mg	600 mg
50+	300 mg	2000 mg	1000 mg	600 mg	600 mg
Forms available	Scored tablets: 100 mg and 300 mg Syrup†: 50 mg/5ml	Scored tablets: 500 mg	Tablets: 100 mg and 400 mg	Capsules: 150 mg and 300 mg Suspension: <i>Contact DSHS Pharmacy</i>	

NOTE: There are many factors that can affect medication stability when tablets are broken or crushed/capsules are opened and then mixed with food or liquids. Consult a trusted drug reference before using food disguises.

*While this table reflects doses for daily dosing, "the optimal doses for thrice-weekly therapy in children have not been established. Some experts use in adolescents the same doses as recommended for adults, and for younger children the same doses as recommended for twice-weekly therapy" (ATS guidelines [cdc.gov/tb/publications/guidelines/pdf/Clin-Infect-Dis.-2016-Nahid-cid_ciw376.pdf](https://www.cdc.gov/tb/publications/guidelines/pdf/Clin-Infect-Dis.-2016-Nahid-cid_ciw376.pdf)). See American Academy of Pediatrics Red Book, 2021, 32nd Edition for pediatric dosing. Consultation with a DSHS-Recognized TB Medical Consultant is recommended.

†Many experts advise against using INH syrup because it is frequently associated with diarrhea.

‡Specialty compounding is needed for doses not commercially available. Contact DSHS pharmacy when compounding is indicated.

Table adapted from Kim Connelly Smith, MD, MPH, The University of Texas-Houston McGovern Medical School

Provided by Authorized Licensed Nurses, Fiscal Year 2022**

Table 4. *continued*

Definition of abbreviations: **INH** = Isoniazid; **RIF** = Rifampin; **RPT** = Rifapentine

NOTE: Short course regimens are preferred to the 6 or 9-month INH regimens

***INH:** Supplementation with pyridoxine (vitamin B6) is recommended in the following: pregnant women, infants receiving INH and breastfeeding, patients with diets likely deficient in pyridoxine, patients with paresthesia, or patients who have a risk factor for paresthesia (e.g., HIV/AIDS, alcohol use, diabetes).

†**RIF, RPT:** Both have drug interactions with potentially serious consequences. Of particular concern are reductions, often to ineffective levels, in serum concentrations of common drugs, such as oral contraceptives, methadone, and warfarin. There are important bidirectional interactions between rifamycins and antiretroviral agents. Because information regarding rifamycin drug interactions is evolving rapidly, consult a trusted drug information resource to obtain the most up-to-date information. **NOTE: Rifabutin (RBT) may be substituted for rifampin if rifampin cannot be used due to certain drug-drug interactions. Consultation from a DSHS-Recognized Medical TB Consultant is recommended for use.**

The American Academy of Pediatrics recommends an **isoniazid dosage of 10-15mg/kg for the daily regimen and 20-30mg/kg for the twice-weekly regimen in children. For more details refer to *Guidelines for the Treatment of Latent Tuberculosis Infection: Recommendations from the National Tuberculosis Controllers Association and CDC, 2020:* [cdc.gov/mmwr/volumes/69/rr/rr6901a1.htm?s_cid=rr6901a1_w&deliveryName=USCDCNPIN_151-DM19855](https://www.cdc.gov/mmwr/volumes/69/rr/rr6901a1.htm?s_cid=rr6901a1_w&deliveryName=USCDCNPIN_151-DM19855) and the American Academy of Pediatrics Red Book, 2021, 32nd Edition.

‡Intermittent regimens of INH mono-therapy must be provided by directly observed therapy (DOT). It is recommended that 3HP also be administered via DOT unless specified by the licensed healthcare provider. Self-administration *may be considered* in select patients when DOT is not possible, and when mechanisms are in place to help patients adhere to treatment, as determined by the licensed healthcare provider. Refer to [cdc.gov/mmwr/volumes/67/wr/mm6725a5.htm?s_cid=mm6725a5_w](https://www.cdc.gov/mmwr/volumes/67/wr/mm6725a5.htm?s_cid=mm6725a5_w) and [cdc.gov/mmwr/preview/mmwrhtml/mm6048a3.htm?s_cid=mm6048a3_w](https://www.cdc.gov/mmwr/preview/mmwrhtml/mm6048a3.htm?s_cid=mm6048a3_w)

Table adapted from Guidelines for the Treatment of Latent Tuberculosis Infection: Recommendations from the National Tuberculosis Controllers Association and CDC, 2020. MMWR 2020; RR-69. [cdc.gov/tb/publications/lbti/lbtiresources.htm?deliveryName=USCDCNPIN_151-DM19855](https://www.cdc.gov/tb/publications/lbti/lbtiresources.htm?deliveryName=USCDCNPIN_151-DM19855)

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

C. Indications for window prophylaxis for contacts to someone with confirmed or suspected TB disease:

1. Children younger than 5 years old. Note: Children <6 months old should continue on window prophylaxis until they undergo a repeat TST at 6 months of age.
2. Patients with HIV infection.*
3. Patients receiving immunosuppressive therapy for organ transplantation. *
4. Patients taking TNF- α inhibitors *

**Indications for window prophylaxis WITH recommendations to complete a full course of treatment for TB infection (beyond the window period) even if a TB screening test administered \geq 8 weeks after the end of exposure is negative.*

D. Interruptions of Therapy for TB Disease:

1. When any interruption of less than 14 *cumulative* days occurs during the initial phase of treatment for TB disease, *the treatment can continue.*
 - If total initial phase treatment is not completed in 10 weeks, the treatment needs to be restarted. Contact the licensed healthcare provider for instructions.
2. When any interruption of 14 or more *cumulative* days occurs in the initial phase of treatment for TB disease, the treatment regimen will need to be restarted. Contact the licensed healthcare provider for instructions.
 - If treatment is discontinued for drug intolerances, the patient must be on an empiric regimen considered adequate (RIP [RIF, INH, PZA], RIE [RIF, INH, EMB], or RPE [RIF, PZA, EMB]) for doses to count towards completion of therapy.
 - If susceptibilities are known and there is no resistance to INH or RIF, then once the patient is on *both* INH *and* RIF, doses can count towards completion of therapy.
3. **If a patient misses a cumulative total of 3 months of doses during the continuation phase and less than 80% of planned doses in the continuation phase are completed,** the treatment will need to be restarted.
 - Collect 3 sputum specimens for AFB smear and culture and contact the licensed healthcare provider for instructions.
4. **If a patient misses a cumulative total of 3 months of doses during the continuation phase and 80% or more of planned doses in the continuation phase are completed,** additional treatment may not be necessary.
 - However, patients who initially had sputum smears positive for AFB should receive additional therapy. Contact the licensed healthcare provider.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

E. Interruptions of Therapy for TB Infection:

When an interruption occurs during treatment for TB infection, a CXR should be obtained in accordance with ATTACHMENT 5: *Chest X-Ray*.

- If a CXR is indicated, an examination and symptom screen to rule out active TB disease are also required before restarting therapy.
- If the patient has symptoms consistent with active TB disease, a symptom screen, physical examination, CXR, and collection of 3 sputum specimens (if sputum can be produced) are required. Active TB disease must be excluded *before* treatment for TB infection is restarted.
- If the minimum number of doses cannot be completed within the maximum time frame allowed, as described in section G: *Completion of Therapy for TB Infection* of this attachment, treatment will need to be restarted from the beginning.

Contact the licensed healthcare provider for instructions.

F. Completion of Therapy for Drug Susceptible TB Disease:

Below are the **minimum** number of doses required, based on regimens listed in *Table 1* and the corresponding time frames for acceptable completion of therapy. The goal is to complete all doses within 12 months.

Six months (26 weeks) is generally the minimum duration of treatment; nine months (39 weeks) is recommended for patients with cavitation on initial chest radiograph and positive cultures at completion of 2 months of therapy (see additional indications in #4, below), and for those patients intolerant of PZA or with *M. bovis* disease. These durations accurately indicate the amount of time the drugs are given *only if there are no interruptions in drug administration*.

NOTE: daily dosing throughout the course of therapy is preferred over intermittent dosing.

1. Initial phase to total 8 weeks:

Initial phase must be documented to be appropriately completed before patient is permitted to count doses for continuation phase.

Regimen 1: 7 days per week for **56** doses administered by DOT in 8 weeks, OR
5 days per week for **40** doses administered by DOT in 8 weeks

Regimen 2: 7 days per week for **56** doses administered by DOT in 8 weeks, OR
5 days per week for **40** doses administered by DOT in 8 weeks

Regimen 3: 3 times weekly for **24** doses administered by DOT in 8 weeks

2. Continuation phase to total 18 or 31 weeks (INH/RIF):

Doses for continuation phase should **not** be counted until initial phase treatment has been documented to be appropriately completed.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- Regimen 1a: 7 days per week for **126** doses administered by DOT in 18 weeks, OR
5 days per week for **90** doses administered by DOT in 18 weeks
Regimen 1b: 7 days per week for **217** doses administered by DOT in 31 weeks, OR
5 days per week for **155** doses administered by DOT in 31 weeks
Regimen 2a: 3 times weekly for **54** doses administered by DOT in 18 weeks
Regimen 2b: 3 times weekly for **93** doses administered by DOT in 31 weeks
Regimen 3a: 3 times weekly for **54** doses administered by DOT in 18 weeks
Regimen 3b: 3 times weekly for **93** doses administered by DOT in 31 weeks

3. When regimens vary from above (i.e., are extended or change frequently) doses from each phase should be converted to “daily dose equivalents.”

- Use the minimum numbers for daily dosing of each phase when making a determination of adequate number of doses to complete therapy. Consult the licensed healthcare provider, the local and/or regional TB program manager, or the TB and Hansen’s Disease Unit TB Nurse Consultant(s) for assistance, if needed.
- *For example, for 5 days per week dosing, 40 doses should be given for the initiation phase and 90 doses should be given for the continuation phase.*
 - If twice weekly doses were administered, multiply the total number of twice weekly doses by 2.5 (because 5 days per week ÷ 2 doses per week = 2.5) to convert twice weekly doses to daily dose equivalents.
 - If 3 times (thrice) weekly doses were administered, multiply total number of thrice weekly doses by 1.67 (because 5 days per week ÷ 3 doses per week = 1.67) to convert thrice weekly doses to daily dose equivalents.
 - Add all daily dose equivalents together to calculate the total daily doses given.
 - Numbers that are not whole numbers should be rounded down.

4. Exceptions to the length of therapy described above:

- In patients with PZA intolerance in the initial phase (minimum of 40 doses given 5 days/week by DOT), or those with *M. bovis*, then the regimen should be provided for a minimum duration of 9 months.
 - EMB may be discontinued only when the isolate is known to be susceptible to isoniazid and rifampin.
 - INH and RIF must be provided for a total minimum duration of treatment of 9 months (39 weeks).
- NOTE: *M. bovis* is naturally resistant to PZA and treatment duration must extend to a minimum of 9 months (39 weeks).
- Patients with cavitation or extensive pulmonary TB disease on initial CXR

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

and a positive culture at the time of completion of 2 months (8 weeks) of treatment are *at substantially increased risk of relapse*. The continuation phase for these patients is recommended to be prolonged to 7 months (31 weeks), to complete a total treatment period of 9 months (39 weeks).

- The following extrapulmonary TB sites generally require a longer duration of treatment:
 - Bone and joint: 9 months (39 weeks) of treatment recommended
 - Meningitis: 9 - 12 months (39 - 52 weeks) of treatment recommended
 - Disseminated/miliary TB: 9 - 12 months (39 - 52 weeks) of treatment recommended
 - Any site that is slow to respond should be considered for prolongation of treatment

- Culture-negative pulmonary TB
 - Defined as symptomatic or radiographic improvement after 2 months of RIPE treatment in a patient for whom
 - a. the clinical suspicion for active TB disease is high,
 - b. AFB cultures were collected and are negative, AND
 - c. an alternative diagnosis/etiology has not been found
 - For adult patients, because of a potential for INH-resistance, treatment should be continued with INH, RIF, AND ethambutol for an additional 2 months to complete a total of 4 months (18 weeks) of treatment.
 - For pediatric patients with no identifiable source case, treatment should be continued with INH, RIF, AND ethambutol for an additional 4 months (18 weeks) to complete a total of 6 months (26 weeks) of treatment.
 - Ethambutol can be discontinued if the patient with culture-negative pulmonary TB is a contact to a case and the susceptibilities of that case are known and no resistance is detected.

- Culture-negative extrapulmonary TB: treatment recommendations are determined by the licensed healthcare provider, preferably in consultation with a DSHS-recognized TB Medical Consultant.

- Patients newly diagnosed with HIV who are not started on anti-retroviral therapy (ART) during treatment for TB: treatment should consist of at least 8+ months of therapy or longer.

- If RIF cannot be included in the treatment regimen, the minimum duration of treatment is 12-18 months (52-78 weeks). **Medical consultation required.**

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

G. Completion of Therapy for TB Infection:

1. Below are the *minimum* number of doses required, based on regimens listed in *Table 4* and the corresponding time frame for acceptable completion of therapy.
 - a. INH/RPT (3HP) =
 - **12** doses (minimum of 11 doses acceptable) administered in no fewer than 12 weeks (but no more than 16 weeks) Doses must be separated by ≥ 72 hours to be counted.
 - b. 4 months of rifampin (4R) =
 - 7 days per week for **120** doses taken within 6 months, OR
 - 5 days per week for **90** doses administered by DOT within 6 months
 - c. 3 months of INH and RIF (3HR)=
 - 7 days per week for **90** doses taken within 4 months
 - d. 6 months of daily INH (6H)=
 - 7 days per week for **180** doses taken within 9 months, OR
 - 5 days per week for **129** doses administered by DOT within 9 months
 - e. 6 months of twice-weekly INH (6H)=
 - twice weekly for **52** doses administered by DOT within 9 months
 - f. 9 months of daily INH (9H)=
 - 7 days per week for **270** doses taken within 12 months, or
 - 5 days per week for **195** doses administered by DOT within 12 months
 - g. 9 months of twice-weekly INH (9H) =
 - twice weekly for **76** doses administered by DOT within 12 months
2. For persons treated empirically for TB disease with at least isoniazid, rifampin, and pyrazinamide for 2 months (40 doses given by DOT 5x/week or 56 doses given by DOT 7 days/week), this regimen can be considered effective treatment of TB infection in persons subsequently determined to have infection rather than TB disease.
3. When changing treatment regimens due to adverse reactions or intolerance, the number of doses needed to complete adequate therapy must be made by the licensed health care provider.
 - a. The decision to restart treatment entirely with a new regimen or

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- counting a percentage of doses taken towards the new regimen should be made on a case by case basis.
- b. Licensed healthcare providers should consider the patient's risk of progressing to disease, compliance, and comorbidities. Some experts recommend that certain patients complete a full course of the new regimen.
 - c. For others, it may not always be necessary to restart the new regimen completely to achieve completion of therapy.
 - d. Refer to *Section 6: Monitoring and Managing Treatment of the LTBI: Testing and Treatment of Latent Tuberculosis Infection in the United States: Clinical Recommendations*, for details.
tbcontrollers.org/resources/tb-infection/clinical-recommendations/

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

ATTACHMENT 8: Patients with Drug Resistant Tuberculosis (DR-TB)

This attachment outlines required activities, procedures, and orders to be performed *in addition to* those outlined in the previous sections of these SDOs.

A. Definitions

1. Isoniazid mono-resistant TB- resistance to isoniazid, a first line TB drug.
2. Rifampin mono-resistant TB (RR)- resistance to rifampin, a first line TB drug; this type of DR-TB is treated similarly to MDR-TB.
3. Multi-drug resistant TB (MDR-TB)- resistance to at least rifampin and isoniazid.
4. Pre-extensively drug resistant TB (Pre-XDR TB)- MDR, plus resistance to one of the second line injectable agents (amikacin, capreomycin, or kanamycin) *or* a fluoroquinolone.
5. Extensively drug resistant TB (XDR-TB)- MDR, plus resistance to one of the second line injectable agents (amikacin, capreomycin, or kanamycin) *and* a fluoroquinolone.

B. Level of Experience, Training, Competence, and Education Required

1. Have reviewed, are familiar with, and able to readily access the recommendations within the following document:
 - a. Treatment of Drug-Resistant Tuberculosis-An Official ATS/CDC/ERS/IDSA Clinical Practice Guideline: Executive Summary, September 2019.
[cdc.gov/tb/publications/guidelines/pdf/executive_summary.pdf](https://www.cdc.gov/tb/publications/guidelines/pdf/executive_summary.pdf)

C. Procedures and Requirements to be Followed by Authorized Licensed Nurses Managing Patients with DR-TB

1. When resistance is identified by drug susceptibility testing (DST), rapid testing (i.e. GeneXpert NAAT), or rpoB alert, whichever comes first, or if resistance is suspected due to patient risk factors, perform the following:
 - a. Contact the licensed healthcare provider.
 - b. Consider holding the current regimen if not consistent with current test results and the patient is medically stable.
 - c. Initiate a consultation with a DSHS-recognized TB medical consultant within three (3) working days. Do not wait for final cultures to initiate consultation, as the consultant will assist in coordination of further testing, including Molecular Detection of Drug Resistance (MDDR).
 - d. Notify the TB and Hansen’s Disease Unit’s Nurse Consultant.
2. Respond to treatment and case management activities where indicated, unless otherwise noted by the treating physician or consultant.
 - a. Drug resistance should be considered in any patient with:
 - Known exposure to an individual with drug-resistant TB
 - Residence in a setting with high rates of primary drug-resistant TB, such as a country or area with high rates of drug-resistant TB in newly diagnosed individuals
 - Persistently positive smear or culture results at or after four months of treatment

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- Previous TB treatment, particularly if it was not directly observed or was interrupted for any reason

- b. **Medical screenings:** Perform the following screening assessments at the following intervals and document on the TB 702 (or equivalent):
 - 1) Baseline and monthly clinical monitoring of medication toxicity for patients on second-line medications:
 - If patient is taking **aminoglycosides** (most commonly **amikacin**), this is to include:
 - audiometry screening.
 - vestibular screening.
 - If patient is taking **cycloserine**, this is to include:
 - A mental health assessment to include depression screening. Also ask if they are experiencing nightmares, hallucinations, aggression or disorientation.
 - If patient is taking **clofazimine**, this is to include:
 - A mental health screening to focus on depression symptoms.
 - If patient is taking **linezolid**, this is to include:
 - red/green color discrimination using Ishihara plates.
 - visual acuity using Snellen chart or equivalent.
 - peripheral neuropathy screening.
 - If patient is taking **high dose isoniazid (adults 15mg/kg)**, this is to include:
 - peripheral neuropathy screening.
 - If patient is taking **bedaquiline (Sirturo)**, this is to include:
 - ECG at baseline, 2 weeks after initiation of treatment, and monthly. It is recommended that the licensed healthcare provider interpret the ECG within 24 hours of the ECG test.
 - Perform ECG at the designated intervals (preferably Monday-Wednesday in case further interventions such as labs or consultations are needed).
 - ECG should be performed at the same time of day each time. ECGs exhibit diurnal variation of up to +/- 75ms during the course of a day.
 - **A patient with elevated QTc intervals should have one repeat ECG done ≥ 30 minutes apart to confirm reading.**
 - Documentation of any symptoms* of prolonged QTc should be included when performing the ECG and results of both provided to the licensed healthcare provider. Ensure the licensed healthcare provider reviews the symptoms and ECG results within 24 hours of test, unless otherwise specified, and documents response in the medical record.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- Respond to the following based on the ECG results:
If QTc is greater than 450ms (in males) or greater than 470ms (in females) and patient is asymptomatic*:
 - Draw CMP plus magnesium, TSH, CBC
 - Contact the licensed healthcare provider to review ECG results within 24 hours
 - Perform weekly ECGs until normal or until licensed healthcare provider orders otherwise

If QTc is greater than 500ms in male or females, and patient is asymptomatic*:

- Hold medications
- Draw CMP plus magnesium, TSH, CBC
- Contact the licensed healthcare provider to review results within 24 hours
- Request that the licensed healthcare provider consults cardiology or a DSHS-recognized medical TB consultant
- Repeat ECG in 24-48 hours
- Perform weekly ECGs until normal or the licensed healthcare provider orders otherwise
- Do not resume regimen until instructed by the licensed healthcare provider

If QTc is greater than 450ms (in males) or greater than 470ms (in females) and patient is symptomatic*:

- Refer patient to the Emergency Department (ED)- ensure there is a referral form that the patient may present to the ED already reviewed by the licensed healthcare provider which outlines at minimum: diagnosis, isolation status, current medications, baseline and current ECG results, symptoms, reason for referral to ED and TB physician contact information
- Do not resume regimen until instructed by the licensed healthcare provider

If QTc is greater than 60ms above baseline and patient is asymptomatic*:

- Draw CMP plus magnesium, TSH, CBC
- Contact the licensed healthcare provider to review ECG results within 24 hours for recommendations

**Symptoms of prolonged QTc include: palpitations, tachycardia, light-headedness, fainting/syncope, chest pain, loss of consciousness, shortness of breath*

Considerations for the licensed healthcare provider:

Correcting the QT interval from ECG readings: The QTc interval is influenced by the heart rate. At a HR of 60, $QT = QTc$ using any of the formulas (Bazett,

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

Fridericia, Framingham or Hodges). As HR increases, the QTc increases. Most ECG machines in the US use the Bazett formula which at higher HR yields a more prolonged QTc than the Fridericia formula. It is recommended to use the Fridericia formula when calculating corrected QTc intervals as studies examining TB medications and QT prolongation used the Fridericia formula in their assessments and guidance. Consider online calculators (e.g. mdcalc.com/corrected-qt-interval-qt-c) or manual calculations.

Refer to algorithms for monitoring and managing corrected QT prolongation in patients with DR-TB here: "Guide for QTc Monitoring and management of Drug-resistant TB Patients with QT Prolonging Agents" available at: challengedb.org/publications/tools/pmdt/Guidance_on_ECG_monitoring_in_NDR_v2.pdf

- c. **Laboratory tests:** Patients prescribed second line medications age 18 or older will have additional labs collected under the following circumstances:
- 1) At Baseline:
 - CBC and CMP.
 - A pregnancy test for females of childbearing age who are starting **clofazimine** and/or on an aminoglycoside, commonly **amikacin**.
 - For patients on **bedaquiline and amikacin**, include magnesium, which must be ordered in addition to the CMP.
 - For patients on **ethionamide, bedaquiline, and para-amino salicylic acid (PAS)**, include a TSH (thyroid stimulating hormone) level.
 - 2) Monthly:
 - CBC and CMP.
 - For patients on **bedaquiline**, include magnesium.
 - 3) Quarterly and as needed:
 - For patients on, **ethionamide, PAS or bedaquiline**, include TSH.
 - 4) As needed and/or per consultation:
 - Therapeutic drug monitoring.
- d. **Radiology:** Posterior-anterior (PA) view CXRs should be performed for patients over age 18; PA and lateral for patients younger than 18 and patients with HIV, in the following intervals:
- 1) Patients with RR/MDR/Pre-XDR/XDR pulmonary TB:
 - During treatment:
 - initially
 - at two months
 - at six months, then,
 - every six months until completion of therapy or as recommended by DSHS-recognized medical TB consultant
 - Post treatment:

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- Every six months for two years, accompanied with a TB signs and symptoms questionnaire.
- 2) For patients who are contacts to MDR/Pre-XDR/XDR TB diagnosed with TB infection, regardless of whether they completed prophylaxis treatment for TB infection, every effort should be made to perform a TB signs and symptoms screening questionnaire and a CXR every six months for two years as this is the highest risk period for developing active disease. If symptoms of TB are present, follow up as indicated (refer to **Attachment 5**).
- e. **Sputum collection:** For patients with pulmonary disease, collect sputum in the following intervals after initial samples:
 - 1) Collect at least three consecutive sputum specimens for AFB smear and culture monthly until culture conversion.
 - 2) Continue to collect at least one sputum specimen for AFB smear and culture after culture conversion, at least once a month, until treatment completion.
 - 3) Every effort should be made to collect at least one sputum every six months for two years after completion of therapy.
- f. **Release from airborne isolation*:** It is appropriate to be more cautious when releasing these patients from airborne isolation. Contact the licensed healthcare provider for best practice. Release may be made in consultation with a DSHS-recognized medical TB consultant if needed. Considerations to release from isolation include:
 - Release to a low or high-risk (i.e. congregate settings, household with small children, setting with immunocompromised individuals, and work site)
 - Patient's response to therapy clinically, radiographically, and bacteriologically (some experts recommend two to three consecutive negative AFB sputum cultures prior to release from isolation.)
- g. Refer to:
heartlandntbc.org/assets/products/guidelines_home_hospital_infectious_patients.pdf and
currytbcenter.ucsf.edu/sites/default/files/tb_sg3_chap8_monitoring_and_cm.pdf#infectionctrl
- g. **Completion of therapy:**
 - 1) Patients with RR/MDR/Pre-XDR/XDR -TB:
 - Initial and continuation phases are different for patients with DR-TB. Refer to consult for dose counting and regimen changes based on response to therapy.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

- 2) Patients with isoniazid mono-resistant TB or intolerance:
- Seek consultation from a DSHS recognized medical TB consultant.
 - Once fluoroquinolone susceptibilities are known and no further resistance is identified, the addition of a later-generation fluoroquinolone (usually **moxifloxacin** or **levofloxacin**) may be added to the regimen.

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

ATTACHMENT 9: DSHS-Recognized TB Medical Consultant Indications

Consultation from a DSHS-Recognized TB Medical Consultant is required or recommended in the situations described below. Exceptions to consultation requirements may be granted if made by the DSHS Regional Medical Director (RMD). In that case, the RMD must either write the medical orders for the patient or include a signed letter in the patient's medical record that the treatment prescribed meets criteria for adequate therapy. Contact information for DSHS-Recognized TB Medical Consultants may be found at:

dshs.texas.gov/disease/tb/consultants/

Consultation REQUIRED when:

1. Patient is a contact to a case of MDR-TB, Pre-XDR-TB, or XDR-TB.
2. Patient has laboratory-confirmed drug resistance or is suspected to have drug resistant-TB.
 - Laboratory-confirmed drug resistance is defined as resistance to isoniazid and/or rifampin, or to any drug other than streptomycin* on drug susceptibility panel testing.
 - Consultation must occur within 3 days of laboratory notification.
**If the organism is identified as *M. bovis* with PZA monoresistance, consult is not required.*
3. When isoniazid or a rifamycin cannot be used due to intolerance or drug-interactions in a regimen for active TB.
4. Patient has positive sputum cultures for *M.tb* after 4 months of appropriate therapy for TB disease and is deemed a treatment failure.
5. Patient has been prescribed a second line medication.
 - Rifabutin can be used interchangeably with rifampin in patients with drug interactions. If rifabutin is used in place of rifampin due to drug interactions, consult is not required.
6. Patient has been prescribed a regimen for TB disease that is less than three times weekly.

Consultation RECOMMENDED when:

1. Intermittent therapy is considered in the initial phase of therapy.
2. Patient has HIV infection and is on or anticipates starting on antiretrovirals.
3. Patient has complex medical comorbidities.
4. Patient has serious forms of tuberculosis, e.g. disseminated or meningeal TB.
5. Patient is under the age of 5 years.
6. Patient's symptoms or CXR have not improved after the first 2 months of treatment.
7. Patient has a positive sputum smear for acid-fast bacilli and/or positive sputum culture for *M.tb* after 2 months of appropriate therapy for TB disease.
8. When therapeutic drug monitoring is being considered, and the patient is not

**Texas Department of State Health Services Standing Delegation Orders for
Tuberculosis Clinical Services Provided by Authorized Licensed Nurses,
Fiscal Year 2022**

clinically, radiographically, or bacteriologically improving after 2 months of appropriate therapy for TB disease.

9. Patient has treatment interrupted for more than 2 weeks in the initial phase of therapy for TB disease.
10. Patient has treatment interrupted for more than 3 months in the continuation phase of therapy for TB disease.
11. Patient has completed treatment for MTB and is recommended therapy again within a 12-month period for recurrence of signs or symptoms.
