### Texas Reportable Preventable Adverse Events Definitions and Guidance v1.7 (04/01/18)

<table>
<thead>
<tr>
<th>Texas Note regarding Severe Harm / Serious Injury</th>
<th>NQF Appendix A</th>
<th>NQF Appendix B</th>
<th>AHRQ</th>
<th>CMS</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQFs Serious Reportable Events use the phrase “serious injury”. AHRQ’s Common formats use the term “severe harm” for assessing the level of harm for adverse events. The Texas DSHS Preventable Adverse Event Reporting program elected to be consistent with AHRQ since the reporting model uses AHRQ’s Common Formats. Therefore, the Texas Administrative Code, Chapter 200.7, uses the term “severe harm” in the list of PAEs. In an attempt to reconcile this difference, the Texas DSHS agrees with these definitions from both NQF and AHRQ and finds that severe harm and serious injury are similar enough to be considered synonymous for reporting purposes.</td>

**Injury**

*Injury,* as used in this report has a broad meaning. It includes physical or mental damage that substantially limits one or more of the major life activities of an individual in the short term, which may become a disability if extended long term. Further, injury includes a substantial change in the patient’s long-term risk status such that care or monitoring, based on accepted national standards, is required that was not required before the event. *(Of note, states and other entities may use alternate definitions for the term “disability.”)*

**Bodily Injury:** Physical harm or damage to a person’s body. *(AHRQ App 2)*

**Psychological injury:** Harm or damage to a person’s psyche, psychological functioning, or mental well-being. *(AHRQ App 2)*

**Harm**

*Harm:* Physical or psychological injury (including increased anxiety), inconvenience (such as prolonged treatment), monetary loss, and/or social impact, etc. suffered by a person. *(AHRQ App 2)*
Serious describes an event that can result in death, loss of a body part, disability, loss of bodily function, or require major intervention for correction (e.g., higher level of care, surgery).

Severe harm: Bodily or psychological injury (including pain or disfigurement) that interferes significantly with functional ability or quality of life. (CF-PIF)

When you face a medical emergency, the last thing you want to think about is how to pay for it. Unfortunately, when people can’t pay their medical bills, costs turn into mounting medical debt that compromises patients’ health and financial security, harms their credit scores, and can even limit a patient’s housing and job opportunities.¹

Research based on the Urban Institute’s “Debt in America,” finds that medical debt is experienced by millions in our state, affecting more than one in four Texans (or 26 percent of consumers with a credit report).² But while medical debt can impact Texans all over the state, it disproportionately affects those in neighborhoods of color: nearly one in three (29 percent) compared to only one in four (23 percent) of Texans in white neighborhoods.³

Large disparities in medical debt across race and ethnicity exist in Texas due to historical and current policies. These policies have created or maintained differences in opportunity and outcomes for people of color. Given that Black/African American, Hispanic, and American Indian Texas families are more likely to accrue and owe medical debt due to systemic discrimination and inequities, their children are also more likely to experience the negative consequences from its financial tolls. These vast racial disparities in Texas medical debt worsen the racial inequality we know to exist in housing access, educational attainment, and other social and economic opportunities.⁴

Twenty-nine percent of Texans in neighborhoods of color have medical debt that has been sent to collections agencies. This rate is six percentage points higher than the percent of Texans with medical debt in White neighborhoods. Texans in neighborhoods of color have medical debt at rates higher than six other Southern states—Alabama, Arkansas, Florida, Georgia, Mississippi, and Tennessee—and far greater than the national average of 21 percent. Oklahoma has the highest rates of medical debt in neighborhoods of color at 41 percent of consumers, followed by North Carolina and Louisiana at 37 percent each, and South Carolina at 36 percent.⁵ Except for Arkansas and Louisiana, none of these Southern states have expanded Medicaid – something that could significantly reduce medical debt.⁶
TEXAS HAS THE WORST INCOME DISPARITIES BY RACE OF ANY SOUTHERN STATE

PEOPLE OF COLOR IN TEXAS MAKE $34,000 LESS THAN THEIR WHITE COUNTERPARTS

Source: Debt in America (2017).
The Urban Institute.

TEXANS LIVING IN NEIGHBORHOODS OF COLOR ARE MORE LIKELY TO HAVE MEDICAL DEBT THAN THOSE LIVING IN WHITE NEIGHBORHOODS

Texans with medical debt also owe larger amounts than those in other Southern states, and more than the U.S. average. The overall median medical debt in collections owed in Texas is $850, though Texans of color owe a higher median of $875. That’s 16 percent more than the average median share for other Southerners of color at $754, and 22 percent more than the national median share owed by Americans of color at $720. Georgia, Florida, and Mississippi follow Texas, respectively, with the highest median amounts owed by neighborhoods of color with medical debt.

Racial and ethnic disparities in Texas medical debt are compounded by Texas’ large income

gap between White Texans and those of color. White Texas households earn an average of $34,541 more per year than Texans of color, the greatest such disparity among the Southern states, and by a margin of more than $3,200.9

Being uninsured is also a significant driver for rising medical debt, since Texans seeking medical attention who lack insurance coverage bear the full expense of health services.10 Due to state leaders’ antagonism against the Affordable Care Act—which hangs in the balance of a Texas lawsuit—Texas has the worst uninsured rate in the country at 19.5 percent, with over 4.7 million Texans under the age of 65 lacking health insurance.11 While 13 percent of White Texans are uninsured, nearly 18 percent of Black/African American Texans and 29 percent of Hispanic Texans do not have health insurance.12 Over half of all uninsured Hispanics in the United States live in Texas, which makes achieving racial equity in healthcare coverage and access all the more important if we aspire to be a prosperous state where people of all backgrounds reach their full potential.13

Racial Disparities Within Counties

Racial disparities among Texas’ uninsured rates are even more magnified at the county level. Seventy-four percent of Texas counties have a higher uninsured rate for residents of color than the state average.14 Of the six largest urban counties in the state, three hold greater racial disparities in uninsured rates between White and non-White areas than the state average. These are Dallas County with a 17 percentage point disparity in the non-White uninsured rate over White uninsured rate; Harris County with an 18 percentage point disparity, and Travis County with a 15 percentage point disparity. Dallas County also has the highest rate among urban counties for uninsured Hispanic residents at nearly 34 percent. Over 15 percent of Black/African American Dallas County residents are uninsured.15

In Harris County, over a third of American Indian residents are uninsured, along with 32 percent of Hispanic and 17 percent of Black/African American residents. In Travis County, the uninsured rates across racial groups are lower, although disparities persist. Hispanic residents there are more than three times

more likely to be uninsured than White residents, and Black residents are more than 1.6 times more likely to lack insurance.16

Other urban counties also have shocking racial disparities in health coverage.

Racial disparities in medical debt align with high uninsured rates. Travis County has the worst racial disparity of medical debt in collections among urban counties, with a 22 percentage point difference between neighborhoods of color and White neighborhoods owing medical debt. In Harris County, the proportional racial disparity of medical debt is not as high, although neighborhoods of color owe an average of $232 more than White neighborhoods, over four times the state average disparity of $54.

Disparities across racial groups are not just an urban issue either, as rural counties have even deeper divides. For example, Karnes County near San Antonio has a 30 percentage point racial disparity in medical debt, the highest statewide. In Harrison County in East Texas, neighborhoods of color owe $693 more, on average, in medical debt than their White neighbors.

Across the state, neighborhoods of color face medical debt with more frequency and in greater amounts.

Medical Debt Harms Children of Color

The toll of medical debt weighs on an entire family. National surveys find that families with medical debt are more likely to forego seeking preventive health care or prescriptions, to take on other forms of debt such as auto or payday lending debt, and to cut back on other basic necessities such as food.

This type of financial insecurity hurts families’ ability to pay their bills and build savings and can have long-lasting negative impacts on children.

Kids in homes with medical debt are more likely to accumulate debt than adults and exhibit more social-behavioral problems than their peers.17

Given that Black/African American, Hispanic, and American Indian Texas families are more likely to accrue and owe medical debt due to systemic discrimination and inequities, their children are also more likely to experience the negative consequences from its financial tolls. In other words, vast racial disparities in Texas medical debt worsen the racial inequality we know to exist in housing access, educational attainment, and other social and economic opportunities.

How Texas Can Address Medical Debt and the Racial Disparities it Exacerbates

In the 86th Texas Legislative session, state policymakers took admirable steps to protect patients from surprise medical billing and other incidents that can throw people into medical debt, but that’s just the tip of the iceberg. These new laws do not address the large levels of debt saddling uninsured patients. Texas is sitting on a growing mountain of medical debt, and Texans of color bear the brunt of the load. As we watch how the courts decide the fate of the Affordable Care Act, Texas lawmakers must implement real solutions to the crushing medical debt burden.

Increasingly, the national discussion on health care reforms has focused on affordability of comprehensive care, with a goal of eliminating the risk of financial ruin due to health care costs. Some of the most potent policy solutions are likely to come from Congress, but states have a number of tools they can employ to reduce medical debt and its unfair toll on people of color.

1. Expand federal health care coverage to alleviate the gap that traps low-income Texans who are ineligible for Medicaid. This includes over a half million adult Texans of color.18 The federal government would cover 90 percent of the cost to expand Medicaid coverage to eligible Texans.

2. Implement strong medical assistance policy guidelines that eliminate or cap exposure to medical debt for poor and low-income patients who are either uninsured, or underinsured with large employer-sponsored coverage. The Affordable Care Act requires all non-profit and public hospitals to offer “financial assistance
TEXANS’ DEDUCTIBLE EXPENSES HAVE MORE THAN DOUBLED IN 10 YEARS

(Avg. cost for Texans with large employer coverage)

Source: Adapted from KFF analysis of data from IBM MarketScan Database and the KFF Employer Health Benefit Survey.

policies” for very low-income, uninsured patients, but does not include criteria for what to include or what the qualifying income levels should be. Clearer state guidelines to promote best practices—such as capping financial exposure for people at or below 200 percent of the federal poverty level—would help Texas hospitals better serve their most indigent patients, many of whom are of color, by preventing exposure to harmful debt levels that undermine patients’ health.19

3. **End litigation and legislative attacks on health coverage, and focus efforts on developing real policy solutions**, by both enhancing public insurance options, and expanding and incentivizing better quality employer-sponsored health insurance. Texas’ sky-high uninsured rate shows we clearly need solutions to get adequate coverage for millions of Texans.

But we also need to make sure Texans are no longer exposed to potentially unlimited and insurmountable debts even when they are insured. Many Texans who are underinsured struggle to meet high cost-sharing responsibilities as part of their health coverage plans. Texans with large employer insurance already spend a median of $900 on out-of-pocket medical care per year—more than 25 other states.20 Nationally, deductibles for large employer-sponsored coverage have more than doubled since 2006.

Access to adequate and affordable health care is a challenge for millions of Texans regardless of race, however Texans of color are significantly more likely to be impacted by extreme medical debt and income inequality that state leaders could mitigate. Texas lawmakers have a responsibility to serve all Texans, and should take action to make sure we have a healthy and productive state for everyone.
ENDNOTES

2 Data used for this report is from credit reporting agencies and therefore only includes consumers with credit reports. This report will refer to these consumers as Texans.

3 This brief uses “neighborhoods of color” to be consistent with our data source, which used geographic data to assign racial/ethnic labels. We draw from the Urban Institute’s report, “Debt in America,” which categorized racial/ethnic shares of medical debt in collections data based on zip codes in each county “that are predominantly White (at least 60% of the population is White) or predominantly non-White (at least 60% of the population is non-White).” Urban Institute defined “the non-White population as those who are African American, Hispanic, Asian or Pacific Islander, American Indian or Alaska Native, another race, or multiracial” (see full report and data at Debt in America: An Interactive Map”).

4 This brief uses the racial/ethnic group labels that match our data sources (i.e. Black/African American, Hispanic, American Indian, Asian). We use “Hispanic” as a separate category, mutually exclusive of the racial category “White,” though we acknowledge that Hispanic people in Texas identify ethnically and racially in multiple ways. Similarly, we acknowledge that the label “American Indian” to reference Native groups is no longer widely used, though was utilized in data collection by our data source, the U.S. Census. The definitions of all racial and ethnic categories are constantly changing and do not match the complexity of individuals or the ways people identify or describe themselves. Acknowledging these limitations of the data, it is still important to collect and analyze data by race and ethnicity to highlight where inequities exist and reduce differences in opportunities and outcomes.

5 Debt in America (2017). The Urban Institute.

7 Data are based on credit records for people who live in zip codes with a predominant racial-ethnic composition: White neighborhoods = zip codes where at least 60 percent of the population is White; neighborhoods of color = zip codes where the population is predominantly people of color (i.e., at least 60 percent African American, Hispanic, Asian or Pacific Islander, American Indian or Alaska Native, another race, and/or multiracial).
