Communicable Disease Chart and Notes for Schools and Childcare Centers

The major criteria for exclusion from attendance in the probability of spread from person to person. A child could have a noncommunicable illness yet require care at home in a hospital.

Methods of Transmission

Variable, Contact with fluid from blisters either directly or on objects recently in contact with an infected person. He does not have to be aware of or so close to the infected person for transmission to occur.

Touching an infected person’s skin, body fluid or a contaminated surface.

Breathing in respiratory droplets containing the pathogen after an infected person has sneezed or coughed. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and touches their mouth, nose, or eyes.

Transmission occurs by directly contacting the fluid from blisters on an object that an infected person handled, such as a piece of clothing, a toy, a book, or a table that the infected person touched.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Touching an infected person’s skin, body fluid or a contaminated surface.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches an object and then another person touches the object and then touches their mouth, nose, or eyes.

Touching an infected person’s skin, body fluid or a contaminated surface.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.

Transmission occurs in respiratory droplets containing the pathogen after an infected person coughs or sneezes. Transmission also occurs by these respiratory droplets if an infected person touches a surface and then another person touches the surface and then touches their mouth, nose, eyes.

Transmission occurs in body fluid of an infected person. Examples include transmission by ingesting food and water, or by breathing in droplets from an infected person’s mouth.
