

## Pediatric Diabetes Short-Term Complications Admission Rate (Observed, Pediatric Population Under Age 18), 2016

Diabetes is a disease in which the body does not produce or properly use insulin. Insulin is a hormone that is needed to convert sugar into energy needed for daily life. Short-term complications are a result of extreme fluctuations in blood sugar levels and can be quite serious. Extreme dizziness and fainting can indicate hypoglycemia (low blood sugar) or hyperglycemia (high blood sugar), and if not brought under control, seizures, shock or coma can occur. Blood sugar levels of diabetic children need to be monitored carefully and their diet and/or medications adjusted accordingly. Regular and careful monitoring and management of diabetes in the outpatient setting can often reduce the risk of developing complications from the disease. Patient compliance with treatment plans is essential to the preventive management of diabetes. Cultural and linguistic factors may affect interactions with health care providers and the system.

Pediatric Diabetes Short-Term Complications Admission Rate (Observed, Pediatric Population Under Age 18), 2016
